Source record: 53999

I have an old Apple Macintosh SE that I would like to use for packet. I am just getting started in this and have been told that this computer would work well for packet. It has plenty of terminal programs on it and such. What do you recommend that I get for a packet modem? Thanks!!!!!

No can do, at least not without adapters. Icom mics require 8vdc and the older Icoms require a preamp as well. Heil Sound has an adapter, but I believe it is for their mics only. www.heilsound.com Go with their Icom-only mics and you'll be set.

150 what plus shipping? US dollars?

Have a look at http://www.rswww.com. For £103 (approx US $150) they will
offer you a new power supply with outputs:

+3.3V @ 23A
+5V @ 32A
+12V @ 12A
-12V @ 1A
-5V @ 0.5A
+5VSB @ 0.1A

RS are hardly the cheapest supplier around either...

3853. Kantronics KPC3 Problem

Newsgroup: rec.radio.amateur.equipment
Date: 2001-09-28 08:04:19 UTC
From: flippit
Message-ID: <D6Ws7.885$812.887@newsfeeds.bigpond.com>
Source record: 54007
Cross-posted to: rec.radio.amateur.equipment,alt.ham-radio.packet,rec.radio.amateur.digital.misc

Hi folks

I hope I'm not intruding, if I am I apologize.

I have two problems - they are an identical installation.
I will describe the setup (same for both systems).

Kantronics kpc3 modem (the model before the 'plus' version) with a maxon transceiver (a radio made in Australia I think?). I do a reset to factory defaults (restore d), change my terminal to the baud rate I want and type in the following commands to set the kantronics to the following:

```
CONMODE TRANS
ECHO OFF
FLOW OFF
XFLOW ON
TXFLOW ON
CD SOFTWARE
HID OFF
MBEACON OFF
FULLDUP OFF
CANPAC $00
CANLINE $00
COM $2B
MYCALL 1001
CHECK 12
AUTOLF OFF
LFSUP OFF
LFADD OFF
CR ON
```

In the office the local kantronics is connected to a PC with radio and yagi antenna on the roof. The remote site has an rs232 device with kantronics, radio and yagi antenna. The units are lines of site about two miles apart. If I turn both ends on and off, I can sit at the local modem and connect and disconnect over and over without a problem. for example:

1. I type: CON 1002
2. I get a successful connect message.
3. I get the welcome message from my remote device.
4. I type: HEY REMOTE DEVICE WHAT'S UP?
5. I get the reply: GREAT THANKS LOCAL UNIT, EVERY THING IS COOL.
6. I type: +++ (pause, get cmd: prompt) DIS.

7. Then the connection hangs up.

However, if I only do steps 1 to 5, and come back ten minutes later, I cannot restart a connection with the remote modem. It is impossible. The ONLY way I can get the connection to work again is to turn the remote end on and off. That's is my problem. It is the same for both of my installations (cities apart) CAN ANYBODY HELP ME?!

Have any of you guys had that problem before?

Please tell me all the things I should test/check.

What (if any) setting are wrong?

I'd appreciate any help! To reply via email please change my return domain to bigpond. Thanks folks and have a great weekend!

bye!
flippit

The cheapest would be a Kantronics KPC-3 if packet is all you wish.
A used KAM if you want multi-modes. If you need more software or
ideas, consider Macnet. Its free.

Macnet is the WWW group of Ham Radio Operators that use Mac computers
to extend their communications capabilities.

3855. Looking for VHF hand-held ... can you advise?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-09-28 13:16:56 UTC
From: vtail@hotmail.com
Message-ID: <3bb46ef0.169716580@news.netis.com>
Source record: 54010

Good morning, all.

I've been inactive for the last 10 years or so and am looking to get back in to VHF FM.

Looking through the Ham Radio Outlet catalog, I see that there are now a lot of handhelds with extended receive capability. So, I thought I'd lay out some specs for you all and see if you can advise me on what is available.

1. MUST be able to use off-the-shelf batteries (AA, AAA, 9V). I have had it with idiot manufacturers who sell radios with proprietary battery packs and then quit making the battery packs. I currently have a perfectly good Kenwood TH-21AT that is useless because I can't buy a battery or charger for it.

2. Receive capability should be 30 MHz to 1.2 GHz, AM and FM (SSB would also be nice but not necessary). I am particularly interested in being able to listen to aviation frequencies in the 108-136.975 AM band. Scanning ability would be real nice.

3. Transmit capability restricted to 144-148 will be fine, though ability to transmit in other bands would be welcome.

4. Antenna connection should be BNC or some other standard (TNC, RCA phono, etc.), or adaptable to one of those with an external adapter, so that it can be used with an external antenna.

The closest thing I've found so far is the Icom IC-Q7A, which does most of what I need except that I can't tell about the antenna connection or the scanning ability on receive. But, its output power is a little anemic at 350 mW ... if I can I'd rather get more like 1 watt or better.

Any suggestions?

Thanks...

I had the same problem. It's the internal NiCad battery for memory storage. The manualo states you need to send it back to Radio Shack for repairs. It ran me about $45 to get mine done a few years ago. Next time it goes, I will take mine to a one of my local shops. The battery itself is only about a 3 buck item. It's unfortunate there is no work around that I know of. The hardest part of replaing the battery from what I remember is that it is seriously glued in place. Take care & good luck.

Russ,

You mentioned cleaning the contacts. Which contacts? This problem, very common, is usually caused by problems within the LCD display itself. There has been at least one report of someone fixing this problem by working directly on the LCD component. I just learned to live with mine, as they usually go way after it warms up or cools off, depending on the season.

I've been trying without success to find a new battery and charger for
a perfectly good Kenwood TH-21AT 2 meter HT.

I wrote Kenwood about it, and they responded with a reply that's
excerpted below. Following is my response to them. You all may or
may not be interested and might want to consider whether you want to
continue to do business with companies that think it's perfectly OK to
build in guaranteed obsolescence into their products so that you have
to replace them every few years.

= = = = =

> available.

Thanks, but so far no joy.

I have completely had it with idiot companies like Kenwood that sell
radios and then quit making the batteries, forcing us to throw
perfectly good radios into the trash and buy new ones!

I know that one of your marketing geniuses no doubt thought that was A
Real Fine Idea to force us to turn our radios into disposables and buy
new ones every few years whether we need them or not.

I for one will never buy another radio that doesn't include the
ability to be used with standard off the shelf batteries (AA, AAA,
etc.), or at least be adapted to use such batteries.

And, thanks to your somewhat cavalier attitude about this ("NiCad
batteries for older radios are no longer available from Kenwood", as
though this was a perfectly normal and acceptable thing and how can we
possibly expect anything different?), I doubt that I'll ever buy
another Kenwood product .. not that Icom and Yaesu and the others are
necessarily any better, but I guess that today was just your day to
piss me off.

3862. Can Kenwood TM-D700A be modified to un-block cellular?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-09-28 17:35:28 UTC
From: johnfofawn@hotmail.com
Message-ID: <d89364bd.0109280935.413d961c@posting.google.com>
Source record: 54016

Hi,

I'm wondering if the TM-D700A radio can be modified to receive the cellular bands?

I need to buy an AOR or Icom R8500 receiver for hearing cell freqs (yes, I have the appropriate certification from the FCC to buy and use such a radio), but if I can get a TM-D700A and do the same receiving PLUS get a 2m/70cm radio then I'd be much better off. When I'm not using the radio for work, I can leave it up as packet station for the local hams.

If the TM-D700A isn't a good choice, do you know of any other 2m/70cm radios that have wideband receive (120 MHz to 2GHz would be ideal -- yes, I know I won't get *that* wide, but I want as wide as reasonably possible).

Thanks,
John

No, it can't be done...not legally, anyway.

And besides, what's the point? Almost all cellular communications
are digital these days. You can't easily decode them.

: TNX

Hi Steve,

You don't say what model or version repeater you have, but I'll be happy to mention a few things. Icom has a few different repeater controller mother boards and they are sometimes different in the same model repeater. I believe they were changed through the years of production.

So for the topic of this follow up, I'll say that the firmware (eprom chip) of the more common Icom Ham Repeaters has locations in the code where various parameters are set. The callsign, length of time out and some other options are modified and the information is reprogramed into a blank eprom.

You need to have an Icom firmware information sheet which might still be had by calling Icom. You use a common eprom programer with software to read, edit then program a replacement eprom.

There were at least two size eproms inside the repeaters I have seen, one is the common 27C256 and the other I think is the 512 size.

Regardless of what you have, I can and probably would program a replacement Eprom for free. Just contact me direct for working that out. I can be bribed with cup of coffee to work faster, but they don't ship through the mail that well.

Drop me a note if Icom isn't much help...

cheers

I have for sale an absolutely mint Kenwood TS-850SAT. I am the original non smoking owner. I have both shipping boxes, hand mic, owners manuals and unopened accessory bag. The radio is a 10 out of a 10 functionally and cosmetically. The radio includes the SO-2 TCXO unit which is a $180.00 option. This is one of the last 850's manufactured. The serial number is 80200024. This is most likely one of the finest 850's you will find. I am asking $1,000 plus shipping from 48026.

Hi Ladies/Gentlemen. There's a couple hours left on my auction for an awesome Icom 820H. Comes with 2, TWO tone boards, vhf/uhf both installed. The CW filter is also installed, and also comes with the mic, which isn't included when you buy the rig. It's in the box, with manual. This would cost you over $1,100 Used at AES. Lots of pics on the ad, so take a LQQK. Thanks for stopping by.

Take Care, Ken.

I have been in a several-layers-deep e-mail exchange with a customer support person at Kenwood this afternoon, and he has advised me that Kenwood has always followed the policy of making off-the-shelf (AA or AAA) battery packs available for all of their handheld radios.

If that's the case, they should probably advertise that fact more clearly. The Kenwood listings and ads in the HRO catalog only show the availability of such battery boxes for two of the five hand-helds shown.

Nevertheless, I should not have characterized Kenwood as an "idiot company" that "sells radios and then quits making the batteries" for them. For that I apologize to them and to you.

I will say that I am quite impressed with Kenwood's customer service; after a bit of a false start, they bent over backwards during a good part of this afternoon to help me fix my problem.

3884. Kenwood TH-21AT and PL, how?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-09-29 01:13:27 UTC
From: vtail@hotmail.com
Message-ID: <3bb51fc1.214988161@news.netis.com>
Source record: 54038

How things change, when one is off the air for ten years or more.

While I wasn't looking, it seems that everyone added PL tone access to all of the repeaters around here.

Do any of you know how to make the Kenwood TH-21AT 2-meter handheld generate PL tones of various frequencies?

It has a "Tone" pushbutton switch on top but the owner's manual has long since gone down the pipe, so I have no idea how to use it.

Thanks...

Eric

If you read my request you would have seen that I am legally allowed
to purchase and use a radio capable of receiving cellular signals.

Anyway, I didn't ask if it was legal, I asked if it could be done.

> And besides, what's the point? Almost all cellular communications
> are digital these days. You can't easily decode them.

Guess what? There are people like me who are 1) smart enough and 2)
get paid to demodulate and decode those signals. Yep, that's right we
do it. So it's necessary to have a receiver to pull in the digital
stream so we can sample it and process it.

Dunno about 6m, but in general most I talk to like the 756 better than the 746. But either one should do the job. The 706 is ok, but needs a good resonant antenna to reduce the HF images you can get. If you try to run a 706 on 6m with a long HF antenna, the low band images can get pretty bad. If you run it with a tuned antenna for 6m only, such as a yagi, it's much better. The 6m yagi is pretty dead on HF, and it kills most of the image problem. I built a 3 el yagi, and it works pretty well now. I don't know how severe if any this problem is on the other radios. If the 706 has a weak link as a receiver, it's on 6m due to this problem. But like I said, if you use a real antenna, it's not a real issue unless you are ultra picky. It kills about 95% of it. It's other weak link on rcve is the longwave band. It's not very good once you drop below 200kc. But what the hey... MK

Eric,

If you still have the battery pack for the TH-21AT, primeval can probably
rebuild it for you, installing NiMH batteries. Their website is:
http://www.primecell.com/index.htm
You can email them for information.

Correction!! That is supposed to say: "If you still have the battery pack for the TH-21AT, PrimeCell can probably rebuild it for you, installing NiMH batteries. " My spell checker got away from me. ;<)

Next time, try AES, their catalog has a listing in the front by manufacturer
that shows all the available accessories for the various model radios.

I've had a Yaesu VX-5R for quite some time now.... I've never had a problem with it. In fact, I'm quite satisfied with it. Yaesu did a real good job in both hard- and soft-ware. My only regret is that I rarely use 6m, and I'd rather have an on-board TNC like the Kenwood TM-D7A. Other than that, I am totally satisfied with Yaesu's construction of their radios... I've dropped my VX-5 no less than 10 times from 3 ft or higher- still works like the day I brought it home from the post office. They built it like a rock. :D

Anyway, that's my opinion.

Might be worth your time to check with Sunn Battery Co., they have a large
assortment of battery packs for HT's.. including some quite obscure ones.

Also, the Icom IC-2SAT has the ability to use AA batteries by purchasing the
readily available BP-90 battery pack.

Eric---your best best is to put out a call on the NGs asking for anyone who might have the old Kenwood TU-6 CTCSS tone unit for the TH-21AT (obviously no longer available from Kenwood)....that's what I had to do and was lucky to find someone who sold it to me. It's a little tricky to install but works FB. Alternatively you may want to contact Communications Specialists as they make a whole range of tone encoders and may have one that will fit the TH-21AT; I got one of their super-duper ones to feed a number of VHF/UHF rigs in the shack that did not have tone capabilities, to include an old Yaesu handheld that needed an internal board.

Building RV-4
Gotta Fly or Gonna Die!

3905. FS: PRO-2004 scanner w/HB232 Interface, numerous mods $350

Newsgroup: rec.radio.amateur.equipment
Date: 2001-09-29 14:14:25 UTC
From: halligan@mediaone.net
Message-ID: <7490b6ed.0109290614.6e2b3596@posting.google.com>
Source record: 53958
Cross-posted to: rec.radio.amateur.swap,rec.radio.amateur.equipment

For Sale: Realistic PRO-2004 Scanner with External HB232
computer-control interface. Pictures available on request. Detailed
information follows:

The Radio: Radio is in very good condition. It has been through
numerous modifications:

1. Full coverage restoration.
2. Increase from 300 to 400 channel capacity.
3. Capability of 36 independent "banks" of 400 channels each,
controlled by toggle switches in rear of radio. Only one 400 channel
"bank" can be scanned at a given time but it affords for numerous
different scanning schemes selected by the switch positions.
4. Pushbutton control on rear of radio to select/deselect keyboard
beeps.
5. Removal of 120 volt power transformer to accomodate interface and
HB232 makings, radio runs on 12 volts only.
6. Front mounted large signal meter. Mounted to the left of the volume
control. As a result the headphone jack is not available.
7. FM discriminator tap on rear of scanner for data decoding.
8. Radio did suffer the infamous PRO-2004 "poor solder" syndrome and
has had such problems repaired.
9. Blue keyboard overlay exhibits 40 channel per bank setup.
10. LCD display is in good shape.
11. Radio has always been in an indoor environment; never used in a
mobile capacity.

The HB232 Interface: Mounted in 8"W x 6"D x 3"H project box. Connects
to radio through short DB25 male cable to DB25 connector mounted
vertically on rear of radio. Connects to computer via DB9 Female
cable. Original HB232 software burned onto CD will be included, as
well as the DEMO version of Redshift, a Windows 95/98/ME software
package for the 2004/HB232 combo.

Miscellaneous: PRO-2004 Owner's manual and PRO-2004 service manual.
Pictures are available on request and will be e-mailed to you
directly. Power supply is NOT included; I run the radio directly from
a custom power setup in my shack. There was never a "wall wort" type
supply included with this radio and as previously mentioned the 120V
transformer was removed to accomodate the DB25 connector and internal
makings of the HB232 interface. The power supply is a standard coaxial
type and is readily available for cheap $$ at Radio Shack.

Reason for selling: Not seeing much use in my shack these days; I'm
gathering money for other radio purchases.

Price: $350 O.B.O., including UPS COD shipping.

Method of payment: Advance payment by POSTAL money order only, or UPS COD with POSTAL money order only.

Please do not reply here, if interested E-Mail me at halligan@mediaone.net

Thanks for reading.

I have for sale a Radio Shack PRO-2050 TrunkTracker. Radio is in "used" condition. Some scratches on display. Body of radio has hole in each side as radio was mounted in a mobile environment. Operating condition is 100% sound. Trying to sell to gather money for new radio purchases. This radio is currently at work collecting dust in my shack. :). I have the original box and manual.

Asking $100 PLUS UPS ground shipping. Payable in advance or COD with Postal Money Order only. Please contact me at halligan@mediaone.net if interested. Thanks for reading.

Good morning, Joe.

Thanks for the info. I have checked their website and a couple of others. Up until yesterday, I didn't know that the inserts were available, and anyway the battery pack didn't want to come upen and I didn't want to take a chance on breaking it. This morning I got it open, saw that the insides are really just 6 AAA cells, and haywired up a low current power supply and a couple of clip leads to try to charge them. So far it looks like they are at least somewhat willing to hold a charge for a while.

I also found a place ... some kind of official or semi-official Kenwood parts repository ... that has some of the PB-21s in stock along with a new charger. So, I ordered a couple of PB-21s and a charger.

Then I discovered that almost all of the repeaters around here are PL'd now (I've been off the air for about 10 years and when I was last active, PL-controlled repeaters were the rare exception). So, it doesn't look like I'm going to be able to use this TH-21AT for very much anyway, unless I can find a PL board for it. Even then, the PL board for this thing is hard-wired to one freqneucy (so I'm told), and the repeaters around here use a bunch of different PL frequencies.

Reminds me when I first got in to 2MFM in the early 1970's, when most 2MFM radios were crystal-controlled with 6-12 channels. You had to pick the frequencies you wanted, and then if you wanted to work a new repeater, you had to go down to the local parts emporium and buy a new crystal (actually I think it was two new crystals, one for xmit and one for receive). Frequency synthesized 2MFM radios were the wildly, un-affordably expensive dream for most of us.

Nowadays everything is frequency-synthesized ... but unless your radio is a relatively recent model, you may well be back to one or a small number of PL frequencies so you still can't access very many repeaters

without performing surgery on your radio.

What goes around, comes around. <sigh>

3910. Re: Can Kenwood TM-D700A be modified to un-block cellular?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-09-29 14:38:43 UTC
From: Gary Fiber <g.fiber@verizon.net>
Message-ID: <T1lt7.189$BQ4.120690@paloalto-snr1.gtei.net>
Source record: 53963

John,

You will find most current amateur products can no longer receive cellular transmissions. It has to do with the FCC Part 15 rules as you likely know. Most amateur VHF / UHF transceivers are Type Certified as scanning receivers. Amateur transitters are not tested and certified under the FCC testing, only the maufacturer has to show it meets the technical standards under FCC Part 97 rules. If one of the amateur companies would allow their scanning receiver, aka TM-D700A to receive Cellular transmissions and the FCC found out it would be a huge fine them. Might even close out amateur products for that company. It is a VERY BIG deal so far as the FCC is concerned. Much bigger than modification for out of band transmission. Those who modify their own product are also being treated as a manufacturer if caught by the FCC.

I suspect any frequency around the cellular range is excluded. Since October 27, 1999 even images produced in the receiver have to be 38 db down acording to FCC Part15 rules for scanning receivers. You are likely best to purchase an open receiver for that purpose since you can prove to the dealers you have credientials to listen on the cell frequencies. I would not expect to find a receiver open to the cellular frequencies on the shelf in the United States though.

Sorry about the spelling on some words, spell checker is not working correctly.

3912. FS: Icom IC-2-GAT 2M H/T with extras $125

Newsgroup: rec.radio.amateur.equipment
Date: 2001-09-29 14:56:38 UTC
From: halligan@mediaone.net
Message-ID: <7490b6ed.0109290656.4d3a0fb5@posting.google.com>
Source record: 53965
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.swap

I have for sale an Icom IC-2-GAT 2 meter H/T. This radio is approximately ten years old and is in good condition. Some minor blemishes; LCD display is clean. Radio has seen light use over the years and has currently been shelved in favor of a Yaesu VX5R.

Extras include high capacity battery, wall wort charger, and insert to allow radio to be powered from external 12VDC source. With original antenna.

Asking $125 plus UPS ground shipping. Either advance payment with POSTAL money order or UPS COD shipping with POSTAL money order only is fine.

If interested in a portable packet setup I also have a Kantronics KPC-3 with wiring for the IC-2-GAT. $170 takes the package, same payment plan as above.

Please contact me at halligan@mediaone.net if interested. Thanks for reading.

They are all like this to some extent. They would be most happy if you buy two new radios every 6 months, as opposed
to supporting a service organization.

There are numerous battery specialists out there who make OEM batteries that typically exceed the performance of the originals.

Vote with your feet.

Message-ID: <20010929150810.21974.00001204@mb-dd.aol.com>
Source record: 53973

The radio has simiar features to the FT-100 but has no remote head. The radio also takes 2.7 khz and 500 hz collins filter...I am not sure if they are standard or options. The radio is also takes 12 volts so no power supply built in. They is DSP built in and has 1) bandpass 2) auto notch 3 white noise reduction. DSP is Audio and not in the last IF. The radio looks like a FT-817 but is the size of the old Yaesu FT-890 and that is sort of what it reminds me of. Oh yes, there is no built in autotuner. Power output and band coverage are the same as the FT-100. The new model is called the FT-897. There is also a replacement of the ICom 746 called the ICom IC-7400. The radio looks the same as the ICOM 746 but the insides are similar tot eh ICom 756 PRO II..basically all DSP stuff and no optional filters to buy etc. 20 K more yen in list price. These models will be anounced in QST by Christmas.

3929. Advice for new hams on buying used HF rigs.

Newsgroup: rec.radio.amateur.equipment
Date: 2001-09-29 23:32:02 UTC
From: public@e.mail
Message-ID: <3bb65941$0$11770$45beb828@newscene.com>
Source record: 53982
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

I often get asked by new hams what is a good used HF rig to start out with.
I always tell them a Kenwood TS440 or some other rig with alot of memory
channels because I've found restructured hams appreciate these rigs more.
For example, the Kenwood TS440 has 100 memory channels, so a new
restructured ham can store all 40 CB channels and still have 60 memories
left over.

I also recommend handie-talkies for VHF/UHF to restructured hams. This way
they don't need to be near a power source whenever they was to kerchunk all
the repeaters in the area.

I'm proud to be able to do my part in supporting the ARRL in their
continuing efforts to dumb down ham radio and turn it into CB.

Elmer

"One day ham license's will be the free surprise in Cracker Jack and
cereal boxes... if we work at it hard enough."
Minutes, April 2000 ARRL BOD meeting.

Carefully open the existing battery case and then replace the innards
with fresh nicads or go with NiMh. Have done that with the older
Yaesu battery packs and saved some serious dollars. It's not a tough
job, just requires some patience and persistance in getting the case
opened without damaging it - from there it's a simple solder job and
then put the case back together with 'model airplane glue'.

3935. Re: New Yaesu mobile transceiver?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-09-30 01:52:51 UTC
From: willy <willyacht@yahoo.com>
Message-ID: <3Sut7.7094$812.18018@newsfeeds.bigpond.com>
Source record: 53987

Lets hope it will have a decent receiver in it. It seems the trend these days is too stuff as much into the box and have very poor RF performance. The FT817 receiver is an example of this all full of gadgets and a thousand birdies. It would be great if some of these companies would get a Mercedes like mentality rather than turning out Walmart Specials.

Source record: 53992

Hi I am reduilding the VCO Circuit #1 on the ts-440-s rf board.
X44-1680-00

I have the list of parts from the service manual except for the
resistors and Values.
I dont know why they did not include the resistors in the manual. The
resistors are on the scematic however some of them are not able to be
read. at least the photo copy that I have. I have the sheilded section
cleaned of parts and glue and will be ready to start the rebuild of the
parts once I can get the resistor values part list.

Should be R-98 thru R-132 or R-136 not sure of the last number. If
anyone can help this would be most helpfull and appreciated. I am
trying to restore this radio
as I purchased it not working knowing that it would take some work to
get back running. Thanks in advance please send any replys to
wd8ejc@amsat.org. or
tuttlerl@wcoil.com Thanks Randy WD8EJC

Try Mr. Nicad he is listed in all the major trade pub. for Ham Radio. I
was able to get a batterie for an old th-26at and they should have some for
the 21. If not they surly have a replacement pack you can replace you old
cell and use the old case. Good luck Randy WD8EJC

Well, ya gotta admit that the post is sadly funny and has a ring of truth to it. We have a few of those CB/Ham "newbies" in our area, too. You know who they are. Buy a Rad Shack HT and tie up the local repeaters for hours on end until their ni-cads go dead. You know them...they have no idea what simplex means. They are really befuddled when they get a UHF HT. You hear them ask. "whats the numbers to set up for the repeaters?" Of course they mean, "what is the offset?". Like that is high math to them....
They further add to this merriment when they say, "I'm gonna call AES and order me one of them kickers that gives me 30 watts out."
There are, of course, the rabble who buy used HF rigs and "open" them so they can use them on 11 meters. 10-4, Good Buddy? I heard that I did.
Oh...and I will NOT touch on the newbie females who find out how to use the auto patch enabled systems. That is another story for another day.

I am thinking about buying a new Alinco DJ-596T HT. I am having trouble finding much information on this radio on the Internet, probably because it is so new. Universal Radio lists the DJ-596T for $220.

Does anyone know where to find a review? Or is there someone who has owned one who could tell me about it? It looks like a very good bet to me.

Well, you're a troll.

But it is interesting to wonder why the manufacturers put so many
memories into HF radios. None of the memories on my FT-847 contain
HF frequencies; only a few VHF repeaters and simplex frequencies.
I don't even know how many memories it has; probably 100. My old
IC-726 had 26 or something and that was about 24 more than I needed
then too.

I don't use the memories on my FT-847, since it's so easy to simply enter the frequency on the keypad... I do use them on my IC-706, but only as quick access to different bands, rather than spinning the tuning knob from now till Tuesday to get from 146.82 to 7.120...

Gee..it takes no large amount of genius to program HF memories into your
FT-847. Trouble is who wants to? You can put 14.313 in memory, but all that
you will hear is a Ham version of CB. Same for 3.950. Why bother? Most Hams
are rather fluid and do not adhere to any one frequency. Of course there are
those few who "park" themselves in one area and who exclude others from
their conversations. They are easily ignored and for the most part they have
little to offer the hobby.

Here we have another spammer. It misleads
in the subject line by saying this item
is FS "OR" For Sale "OR" misleads and
indicates said item is for sale when it
is actually FA = For Auction. The FA is
used by those of us that do not Do Auctions.
We set our spam filters for FA in the subject
line and we do NOT have to see the auction
spam. Do not trust this person.

"If they Lie in the subject line"
They will have no problem misrepresenting
the JUNK they have at the Auction..

If you have received this message it is
because I saw a subject line that interested
me and when I downloaded the message
It was nothing more than your auction SPAM
and was NOT what the subject line said it was.

Some of the Real Sleazy people will make
it look like a reply to another message.

Easiest way to avoid this message?
Do NOT LIE in the subject line..

Just My Opinion..

Bob

Here we have someone that doesnt READ the posts. The subject line is not in error, many people have ebay STORES in which they post regularly available or even one time items FOR A FIXED PRICE. I can understand your problem with people posting FA items as FS.. I don't much care for that either.. but this person clearly emphasizes the words PURCHASED and STORE, meaning that the item is not for auction, but for sale.

Don't automatically assume that when you see 'ebay' or an ebay link, that it's always an item for auction. This is no longer the case. I have bought things off of ebay both ways personally.

Why recommend a radio that has 100% failure rate? It's not a matter of if the PLL will go bad, but when. Kenwood goofed on the potting compound and it will eventually take the radio out. This used to be common knowledge.

Brenda:

Don't tell us that Hawk is an abusive idiot -- tell his ISP and the service where he cross-posts his junk.

Just write them a polite note explaining that their customer is deliberately and repeatedly abusing multiple newsgroups with his cross-posted, off-topic, factually-incorrect rantings. You might also mention that several attempts have been made to resolve the problem by attempting to educated this abuser but he continues to send the same abusive form letter every time he finds anyone using eBay and posting a message indicating the item is "for sale." You should probably include a brief explanation of the fact that not all items listed through eBay are for auction - many items are fixed price and therefore clearly are "for sale" NOT for auction.

Be sure to include the full headers (it is best to use the show PAGE SOURCE function in your news reader then cut-&-paste the entire message into your complaint, as well as "forwarding" his abusive message. Also be sure that you send the complaint to both his own ISP and the service where he posts the abusive messages.

What a freaking appliance op. Open the damn case and replace the batteries by yourself. Geez. Or do a TINY bit of research into one of the after-market battery suppliers. Only fools purchase the expensive original equipment batteries anyway.

Gawd. Being associated with hams these days is embarrassing.

You are wrong. You can purchase it outright. READ the listing. It's a
plain sale and 15 are available. No auction involved.

Look on eBay. There are usually several for sale and the pricing is not unreasonable. Try to sell the old Atlas there, too. Somebody might want it.

Gee, I wonder how long my TS-440 SAT has until it turns into a
pumpkin?? Had it now for about 10 years and so far so good! There goes that
100% rating huh. Oh well, maybe I got the 1 in a million so that won't screw
up the record will it? And as far as those restructured hams go, I believe
if we all look back a little in time we will see that even we started out
with a 4 channel (or 23 or maybe even a 40 channel depending on our age)
cb that stimulated our interest enough to further our radio experiences. "It
must be lonely at the top" looking down at all those peasants.
"Porky".. "Miss Piggy's Favorite Bacon Maker down here in the
Sand Pile"! 73 there "Good Buddy" and I'm back quiet. Hi hi.

Every few years, Eric?

I dug back through my collection of radio product literature to get an idea of how long it's been since the TH-21 was dropped from Kenwood's product line. I find the TH-21 listed in a February 1988 Kenwood USA Amateur Radio General Catalog, but don't find it listed in the March 1990 version of the same catalog.

In other words, the TH-21 has been off the market for at least 10 years.

How many amateur radio manufacturers still carry accessories for radios that have been out of production for over 10 years? I'd bet that not many, if any.

A few other thoughts regarding your search for the "perfect" handheld:

1. Many of the handhelds on the market today have an accessory dry cell (AA or AAA) holder that can be used in place of the standard rechargeable battery pack. Yes, it's something else you would have to buy, but if you never plan to use the standard rechargeable pack, maybe you can sell it to cover your cost of buying the dry cell holder.

2. Wideband receive capability is sometimes A Bad Thing in today's handhelds. As hard as RF designers try, getting wideband receive, good selectivity, and high resistance to overload/intermod all in a package as small as a handheld radio is difficult. The Radio Shack HTX-202 was a good 2m handheld because it _didn't_ receive from DC to daylight, consequently the receiver was very resistant to overload and intermod. My advice may sound cavalier, but if you want a scanner, buy a scanner. If you want a good 2m handheld, concentrate on good receive and transmit characteristics in the 2m band.

Good luck!

My IC736 has around 100 memories, I think. I can't remember for sure because
I don't use them for HF. Too easy to enter the freqs on the keypad.

On the 706MKIIG I had in the truck, that was another story. Used it on 70cm
all the time and had my favorite repeaters programmed in.

My new FT817 only has ONE memory channel programmed and it too is a UHF
repeater.

Ol' Elmer Fuddy-duddy must be his name because if he was a TRUE Elmer, he'd
be reassuring NEW or RESTRUCTURED(if you will) hams and teaching them proper
operating techniques and all of the fun aspects that Amateur Radio has to
offer.

We have a variation of that here...

The newbie who shows up as fresh meat to the local ham club
is bedazzled and all revved up in the belief that ham radio is an
institution, and that all hams adhere to a chivalrous code of ethics
and brotherhood. Then the big wheel club icons get them to
buy the most expensive radios they can afford and finally screw
around with them until they sell their radios at ten cents on the
dollar to this snickering bunch of club craphounds, or simply
resign themselves to shut-up and show up at the meetings and
pay their dues like the rest of the captives who show up regularly.

What these poor newbies never find out, is that it doesn't have
to be that way. The local club meeting may only account for
2% of the local ham population because the rest don't have the
inclination to play the games of The CLUB and worship their
kingdom.

These "others" are more often better rounded and may actually
have jobs and family, and may even spend 3 out of 4 weekends
on family outings, and very probably spend more time on radio
projects or operations on their own because they enjoy the real
ham radio hobby more than club politics and pecking orders and
in general have transcended the brainwashing and NEED for
congregating at the muddy water hole.

If you want to congregate (and there are good reasons to do so)
be aware of your surroundings and keep your wits as you enjoy
the company of (some) others. Don't be like the teenage girl who
steps off the bus in the big city for the first time, right into the
arms of her new PIMP Daddy!

:

On the other hand, whose idea was it to integrate cartoon characters
into an originally normal, regular mature hobby?

I still think recruiting die hard CB'ers for Ham Radio, is like trying to
save a street hooker by marrying her... Doomed to disaster!

Why bother with a membership to the country club, if all you want to
do is pee on the green.

Good afternoon, Robert.

You miss the point.

See below...

>1. Many of the handhelds on the market today have an accessory dry
>cell (AA or AAA) holder that can be used in place of the standard
>rechargeable battery pack.

That is all I have ever asked of them.

If manufacturers do that (and it seems most of them do, these days),
then there is no longer an issue with having some proprietary design
battery pack, without which the device is useless.

It does appear that such a pack was available for the TH-21AT at one
time, but my vague recollection is that when I bought mine, the dealer
didn't have any of the AA or AAA boxes in stock and wasn't able to get
them for several months. I think there was a period of time there
when they weren't being made, or weren't being imported, or something.

If you've seen my "Apology to Kenwood" thread you know that I've found
out a few things and retracted most of what I said about them. In
fact their customer service people have been VERY helpful to me in the
last several days on the issue of getting my TH-21AT back on the air.

Mostly as a result of their helpfulness, I plan to buy one of
Kenwood's new TH-F6A hand-helds as soon as the local Ham Radio Outlet
gets some more in stock.

> 2. Wideband receive capability is sometimes A Bad Thing in
> today's handhelds.

Sure, I know that, it pretty much goes without saying. I don't expect
to use it for anything particularly demanding ... accessing the local
repeaters and some idle listening on HF, AM, FM, and the aviation band
are all I need (the TH-F6A actually does considerably more than I
need). I don't live in a high-RF area and rarely travel in such areas
so intermod and overload aren't critical issues. I have no need to
separate pileups or pull in some S-2 signal out of Diego Garcia.

Should I ever feel the urge to get back into DX work on HF (and I'm not sure I ever will), I still have my oldie-but-goodie IC-735.

One of the conveniences of having 100 memories is the ability to choose
a memory channel number that is a mnemonic for the frequency. Thus I
have used the following on my HF Transceiver
66, 77, 82, 88 corresponds to most listened to broadcast stations
66 = 660 Mets games, 77 = 770 Yankees, 82 = 820 NPR, 88 = 880 All news
station
5, 10, 15 are WWV at 5, 10 or 15 MHx
6 = 28,885 6 meter DX coordination
I have a few other stored but as you see most are not for use for
transmitting.

The VX-5R is a good handheld...except for the receiver not being able to deal with high RF areas. Another problem the VX-5R WILL NOT make a full 5 watts of power on either band with the regular battery supplied with the radio. To get a full 5 watts out of it you must run it off of a external 12 volt source....and by the way..when doing so please wear a "oven mitt" as it gets smoking hot on high power and 12 volts. Dont even think of running it at that power level while mobile for any amount of TX time...for mobile use..get a real radio.

I always recommend that they build a CW rig from scratch. A couple
dozen components can be assembled into a QRP transmitter that will
teach them quite a bit about building and applying some of the theory
they studied, and will enable them to communicate with stations
half way around the globe. There is no greater thrill than having
QSOs on equipment you've build yourself.

From: "David P." <KD5LOE@ev1.net>
Message-ID: <3bb7e5ba_2@newsa.ev1.net>
Source record: 54090

I just got a IC-718 I notice that on SSB that loud, wide banded local and some DX signals sound kind of choppy and scratchy. These signals sound clear on my other radio. Is I have to turn on the Attenuator and cut back the RF gain to clean up the signal, then open it back up for a weaker signal. This gets old real quick during a QSO.

Will a SSB filter clean this up? What is usually used for this condition? I will also add the ut-106 dsp unit.

I was re-reading the 718 review in the Jan 2001 issue of CQ magazine. The author states that both the TX and RX audio can be improved by replacing the stock FL 65(2.4khz) with the FL257(3.3khz). Has anyone done this mod? How bad does it hack up the radio?

thanks for any thoughts,
Dave

Memories on HF can certainly be useful for many operators. For example, net operators can store net frequencies. People who use modes that have fixed gathering frequencies (RTTY, SSTV, QRP, etc.) can put those frequencies in their rig. And they're an obvious win for the 10m repeater users, if there is anyone still doing that.

On the other hand, HF memories are pretty useless to the typical contester or HF ragchewer. But they add little or nothing to the cost of the radio (once you have a microcontroller-run radio, memory is easy to do), so you might as well have them.

Perhaps you haven't noticed that the FT-874 is a general coverage receiver, covering the shortwave broadcast bands as well as the ham bands. Those memories are handy for storing common shortwave broadcast frequencies, as well as commonly used ham frequencies.

I also have several of my previous employer's HF frequencies programmed into memories. And, since I'm a member of the USCGAUX, I have some memories set aside for the HF marine frequencies. I also have a dozen or so memories set aside for local HF and VHF civil defense frequencies, and for VHF marine frequencies.

All of that uses about half of the memories in my FT-847.

There you go! I built a couple of dead bug pip-squeaks before
cobbling up power supplies for TCS boatanchors. The joy of
discovery! (and reverse engineering)

When I was in High School, there was a kid who actually tore up
transistor radios and junk and built up a QRP transmitter/receiver
and mounted it all with a battery pack on his bicycle. We used to
poke fun at him a bit, try to give pointers and ideas on how to
improve and elaborate on it and he'd get pissed off. A couple of
us pulled him aside and told him we were proud of him for doing it,
and only wanted to help with the project.

That was the neat thing back then, everyone had different projects, but
we could all jump in the middle and participate vicariously.

These newbies only find the joy these days after they bring it all home,
plug it in and find out they need to come up with an antenna...

Jim, AC6TK

: I always recommend that they build a CW rig from scratch. A couple
: dozen components can be assembled into a QRP transmitter that will
: teach them quite a bit about building and applying some of the theory
: they studied, and will enable them to communicate with stations
: half way around the globe. There is no greater thrill than having
: QSOs on equipment you've build yourself.

You should get in the habit of sending a disconnect request and
receiving acknowledgment at the end of the exchange before
walking away.

I'm not intimately familiar with Kantronics, but there should be link
time-out parameters, so if there is nothing sent for several minutes
both the units will initiate disconnect request, then terminate the
link after retry out.

If you are looking for a more permanent link, look into commercial
data solutions.

4002. IC-271H Scan wont stop on active channel

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-01 17:06:58 UTC
From: glen@glensworld.com
Message-ID: <665c5f12.0110010906.2e948987@posting.google.com>
Source record: 53906

I have just picked up an IC-271H 2 meter all mode. It seems to work fine except it will not stop on an active channel when scanning. In memory mode, when it scans by a channel that is active, you will hear about a half second of it as the radio scans right by to the next channel.
The is not a huge problem for me since I purchased the radio for satellite work but i had hoped that the rig could double as an fm rig (scanning local repeaters). Do I just not know how to operate the thing, or is it broke?

Also, Is this radio still considered a decent one or would a modern one make a huge difference (in ssb receive capability)?

Thanks!
-Glen

I also echo Mike's comments on the VX-5R...I've had one for a couple of months now, and haven't had a problem with it. It's more expensive than other HTs, yes, but it's built like a brick. I live out in a rural area, so I don't worry too much about intermod, but man! On long QSOs (especially if the case is in the sun), the radio gets *really* hot.

Before I got the VX-5R, I was looking at the IC-T82A, but they cancelled it. If some company comes out with an HT that does 5 watts on 50, 144, 222, and 440 mHz, I'll get it (perhaps a "Yaesu VX-8R"?), but for right now I'll echo the fact that the VX-5R is a quality HT.

Hi all, This Wednesday Oct. 3rd is The First Wednesday CCA AM night on 3880kcs!

Please come and join us for an evening of great sounding signals. REMEMBER you DO NOT have to be running Collins gear to checkin. Everything is welcome!

We will have 4 main ncs. One on the East coast, Midwest, Mountain area, and West coast. The main ncs will have others in their area helping with their hour. (Please note ONE HOUR). At the end of their hour the main ncs for that region will contact the next regions ncs and turn ncs over to them etc.

Each ncs will start at 08:00pm in their time zone.

Starting at 8:00pm EDT (0000 UTC) East coast ncs will start the net
At 01:00 UTC East coast ncs will turn ncs to Midwest ncs
At 02:00 UTC Midwest ncs will turn ncs to Mountain ncs
At 03:00 UTC Mountain ncs will turn ncs to West coast ncs

comments please to wa9vrh@ocslink.com

Have fun and enjoy the great sounding AM signals. 73's Larry WA9VRH

Howdy,
I have a Kenwood TH-215A and I lost the owners manual.
I've contacted Kenwood but they no longer have the owners manual
available.

Does anyone know if there's a web site or FTP site where I can view or
download a copy?
Could someone please help me and send me a copy of this manual?

I would gladly pay postage & reasonable copying costs. If you are a
trusting HAM you can even mail me the manual & I'll copy it myself.

I can't figure out how to program the frequencies into memory and use
the other bells & whistles.

Best regards,

Erik

Source record: 53922

I have a ICOM706MII and when i brought it I did a side by side test with the FT-100 and to my ears the ICOM would pull in stations better so I went with the ICOM I use the ATAS 100 antenna with my ICOM by using a AM-COM converter and it works great for me. The thing I like about the the ICOM is the signal finder on the display which lets you find signals on any band you are working which i did not know it had when i brought it, all radios should have that feature. Had my ICOM over 2years and no problems so far.
Great radio and the G is better with the all lighted buttens and 440MGH.

4021. Re: Confused on first radio selection

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-02 06:47:13 UTC
From: Tim <sixfingers.removespam@texoma.net>
Message-ID: <9pbo470jl3@enews4.newsguy.com>
Source record: 53925
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment

First of all, let me say thanks for all the replies so far. After hearing all advice and doing even more research, I have come to the conclusion that one radio will not suffice for all I want, as one reply noted. So, I have decided to go with the Kenwood TM-D700A for my first. This will allow me to get some on the air experience with a dual band mobile, as well as some extra's to pursue with the APRL and packet features this radio provides. I am still very interested in HF and DXing, but since I have yet to take my general exam, and even get on the air, this seems like a logical first choice for me. I will look into getting a full time HF base rig of some sort, once I get my upgrade not to mention a little more experience.

Thanks again for the replies. I look forward to hearing some thoughts on base rigs in the near future as well as meeting some of you on the air perhaps.

Are you looking for a 6 meter-only rig? If so, I've heard good things about Icom's IC-551D, even though it's an older rig. Also, Kenwood's TS-60 might be worth checking out. I don't have personal experience with either one of these, so I can't give you a real review of them.

If you already have an HF rig, you could always get a transverter, like Ten Tec's 1208, and be on six with 10 watts. I use one with an FT-840 as the IF rig, and the setup works well. Haven't worked a band opening yet (bad luck, I guess), but I listen to all the local stations and beacons.

Hope this helps.

October 2

I am setting up my first ham station and just connected my inverted V dipole with about 40' of RG58U co-ax. When I transmit on any of the frequencies covered by the antenna (10 to 160M) I get SWR values that are all greater than 3. Is the co-ax likely to be the problem? I don't find specs for RG58U
in the ARRL manual. It is described as being 52 ohm RF cable on the packaging.

Hi Geoff,

RG-58/U coax will work fine for your installation, and it is
not likely the cause of your high VSWR. What antenna are you
using? How do you have it installed?

Aren't you glad that this isn't an eBay or For Sale post.....anyway....

My trusty IC-735 has lost receive on a couple of band segments due to the front-end preselector diodes blowing out (again). In the past I found these switching diodes available at R.L.Drake as they are used in my R-8B. Paid about a dollar each for them there. I have never been able to find them available at the usual suppliers at a reasonable price.

Any suggestions on where to find the diodes on the Web? Any suggestions appreciated.

Thank you all for your opinions. After reading them, as well as others e-mailed directly to me, I bought the TR7. I found that the prices for TR7's are running 20% - 30% lower than Corsairs in similar condition. The PA's of the TR7's seem to be more robust and they are ready to go when 5 megacycle activity starts.
Reports on the receivers of each also favor the TR7 although some Corsair owners argue this point . I'll have to live without QSK which is a feature I wanted.

I bought the radio from a fellow down in GA and should receive it next week.

Thanks to all.

RG 58 is just fine for HF barefoot operation. You will probably
need a lot of fiddling to bring the SWR down on all bands from
10-160 (if you can). I take it you have either a fan dipole or some
version of G5RV? Measure the lengths carefully and record SWR
for various lengths on different bands. Avoid actually cutting the
wire. Instead, wrap any excess back on the wire. It is typical for
adjustments on one band to throw off other bands, so you will
probably need a few weekends to get it into the ballpark.

There are so many variations in individual installations that this
is so normal out of the box. There are various test items through
the years that make this easier. Grid dip meters, Noise Bridges,
Antenna analyzers can save your knees from frequent ladder miles.

Hi Geoff:
Sounds like you need a Transmatch between your Transciever and coax to
ant. This is the only way to get the SWR down on a dipole that you are using
for 10-160 meters. Your dipole will only be resonant for one freq.
RG58U should be OK unless you are running high power. I use RG8X and run
600 watts.

Well, suppose we could start out with type acceptance...etc..etc.
But I'll keep it simple, it was manufactured for Radio Shack and radio shack
made sure it was not modifiable before they sold it. I've checked high and
low, and no Tx mod is available. My FD uses Uhf, although 300mw or so would
be absolutely useless.

> cellular bands?

Well, most all US versions have the cell freq's effectively blocked as others have said, doe to legal issues. However, many of the same models destined for other parts of the world do not have this limitation. I suspect that in modern processor controlled radios, it's firmware that blocks it. This may or may not be possible to reprogram, it's probably safe to say you won't get any info on that from the manufacturer.

So, you could check the spec's on one of these receivers destined for non-US markets and see what it takes to buy one. It might be impossible due to import restrictions or some such, which would also prevent you from legally buying it in another country and bringing it into the US.

<SNIP!>
>
> If the TM-D700A isn't a good choice, do you know of any other 2m/70cm
> radios that have wideband receive (120 MHz to 2GHz would be ideal --

> possible).

Well, if all you want is a receiver (kills the packet station idea), then it all depends on what you consider a "receiver" and how much you want to pay. There are numerous receivers for sale with that bandwidth (and more) with no blocking whatsoever. For instance, I have a real nice HP spectrum analyzer that tunes from 100Hz to 22GHz. I can take one of various IF outputs or the baseband output and demodulate it with whatever methods I choose. It makes a dandy ultra-wide band receiver, but, it'll cost you around $50K to buy one new...

Hi,

Until one our ago I enjoyed the sound or my Saba Freudenstadt 7 (�1957).
Then I suddenly heard only bzzzzzzzzz..... never had a problem before.
Within 10s I switched off but smoke came out already.

After opening some windows to get rid of the smoke, I took off the back.
The transformer looks a bit burned.

Does anyone have an idea whether something can still be usefull to do?
Is it possible to install a modern transformer? Would anyone have technical
data?

Thanks in advance, Leon

Part sets show up from time to time on ebay...and I'll bet it wouldn't
necessarily have to be a Saba. I had a similar thing happen to a Grundig
set. Luckily I caught it in time, but it was antiquated rectification at
fault. I'm sure someone more knowledge able can elaborate, but the
technician installed up to date rectification.

My biggest complaint with the FT100 is the "dongles" for the rf connections.
This will have to lead to problems sooner or later, sooner if the things
move around much.

It is possible that a winding in the transformer shorted, or maybe
a capacitor, such as an electrolytic filter capacitor shorted. If
that is the case the transformer may be OK. I am not familiar with
this set, but if you can identify the rectifier tube and pull it,
then power the set up again, keeping your hand on the switch, and
see if it smokes again. If not then the transformer is probably OK
and the problem is elsewhere, if it does, then the transformer is
more than likely gone. I am assuming the 1957 in your posting is
referring to the approximate date of set and it is a tube type.

The Drake TR7 is a benchmark receiver even today. Drake did a superb job on this radio. Its blcoking dynamic range and third order intercept point is high compared to many radios of today. Considering that it was designed almost 20 years ago, it puts to shame the current manufacturers design ability considering we dont have a radio that will kick the Drakes TR7 receiver. So much for progress! More like Bells Whistle progress.

One minor complaint about the the TR7, is that some models were know for bad key click problems. So if you a serious CW buff checking this out would be in order.

Most probably you do not need a new transformer, because they can
stand a lot and may even survive some temporary heating. The cause
of the smoke is probably a short circuit in the power supply. This
can easily happen with the little yellow capacitors (with paper
cover) used in German sets of those days: they short out suddenly.

Try to locate and replace the culprit, check your rectifier and then
see if your transformer is still OK.

Gerard.

Is this an all band antenna that is resonant on it's own on each band?
If so, it may need the lengths tweaked a bit. Make sure other
wires/metal are not in the area of the antenna. That coax is fine for
general use. If you used RG-8 coax instead of the rg-58, the SWR would
likely go up even higher due to the lesser feedline losses. The higher
losses in the 58 actually mask the mismatch a bit.
If you have coax bad enough, you can directly short the end of the
coax with a pin, and still have a good SWR. It would help to know what
kind of antenna. Some "all band" antennas need a tuner to work all
bands, and in that case ladder line should be used. I assume yours is
not one of these, but a trap loaded affair resonant on each band or
something along those lines??? MK

October 3

Thanks for all the replies and help. It seems clear that the type of co-ax
is probably not the problem with my very high SWR.

The antenna is a commercially supplied "all-band" dipole type (10, 15, 20,
40, 80, 160) with separate wires for 10 and 20 and two sets of traps to
allow 80 and 160.

Mark noted that I should be careful about wires and metal in the vicinity.
I have a long-wire antenna (for short wave reception) strung a few feet above the
dipole. I will take it down and see if that reduces the SWR on
the dipole transmissions.

Agian, thanks for all the helpful replies.

"Courier" and "Thunderbolt" do sound like CB amp's but they may well be too old to be illegal. They'd be useable on 10 meters and possibly other bands provided they don't generate too much harmonic power. I have zero knowledge of there particular units but most old tube amps date back to the days before 11m became CB and some are of decent quality. They're worth little $$ but if I had them I'd try them on 10m then other bands after checking harmonics and adding a low-pass filter if needed; especially if I also had an old SSB CB I could convert to 10m.

Is this Freudenstadt thing a tube-equipped radio...
If so and the power transformer is "smoking" as you described it could
be the rectifier. This is a bridge (4 diodes). I remember Blaupunt
Radios from that era that allready had semi conductor rectifiers.
Somethin like B250 C .... This item could be short circuited causing the
overload of the transformer.
When you are lucky the transformer is not damaged and you only need to
replace the bridge rectifier.
(Alvorens trafo te vervangen controleer brug-gelijkrichter op
kortsluiting (B250 C....). Met geluk is trafo nog goed.)
Succes (summary in Dutch)

Only would be useful on the fireground. As far as fire repeater frequencies I would also agree with your statement. I have heard of a few people who have used Motorola or other commercial devices normally used for fire or law enforcement where they have had crystals or programming to transmit on the ham frequencies. (Yes, they had ham licenses too).

Sounds like they took the type acceptance thing backwards.

Ryan

You are right Ryan. Most modern day commercial handheld have enough
range that they can have amateur frequencies programmed in to them.
I would not feel comfortable using a Radio Shack hand held at a fire scene.

Begin your finer adjustments on the lowest frequency bands, and
work your way to higher frequency bands, always going back to lower
bands to see what changes. Your other antenna may be at 90* for the
least interaction, but you may be able to keep it and still tune your
multi-band dipole. When lines are parallel, you have the most interaction
and your other antenna will overcomplicate matters.

Your dipole sounds very much like our Alpha-Delta brand. It is a
combination of fan dipole with loaded sections for the lower bands.
All of the parallel lines are very interactive. With patience, you should
be able to adjust this antenna so that you won't need a tuner for 10-40
operation, but you will be limited on 80 and 160 without one anyway.

Jim, ac6tk

"Geoff Ralling" :
: Thanks for all the replies and help. It seems clear that the type of co-ax
: is probably not the problem with my very high SWR.
:
: The antenna is a commercially supplied "all-band" dipole type (10, 15, 20,
: 40, 80, 160) with separate wires for 10 and 20 and two sets of traps to
: allow 80 and 160.
:
: Mark noted that I should be careful about wires and metal in the vicinity.
: I have a long-wire antenna (for short wave reception) strung a few feet above the
: dipole. I will take it down and see if that reduces the SWR on
: the dipole transmissions.

I find that Fords and Chevys have a fair amount of fuel pump
noise. My Astro was so bad that it radiated S7 noise from the
wiring on all bands once the antenna was resonant. I added .02uf
across the leads at the pump and sender wires and it all went away.
I use a remote tuner at the antenna and well shielded coax and have
had no problems with any of my Chevys. You should route your
coax away from vehicle wiring and stay well away from the CAT.

In my professional experience, most of the times when the radio
interfered with the vehicle electronics, it was because of high SWR
or even a loose antenna connector. On only one occasion was there
ever thought to be damage, but we couldn't verify because the
customer went to the dealer first and they replaced the ECM. In that
case, keying a low band 135 watt FM radio would cause the Chevy
Pickup engine to stall. We relocated the 30 MHz antenna (with a bad
ground) from the passenger side cowl (right over the ECM) to the
roof.

I hear the same about Harley Davidsons; mostly from folks who've never owned one.

About 20 years ago I "liberated" 2 RF amps from CBrs and made a lot of CW contacts driving them with a kit-built QRP rig. Both amps are as well made as any of the 2-meter bricks I've bought since, and neither made TVI, so I suspect that their rep for harmonic generation & distortion comes from CBrs and Appliance Hams over driving them; altho a good lo-pass filter makes good insurance.

A mod'd CB driving a "linear" followed by a filter may be junk compared to the latest & greatest digital off-the-shelf appliances but just might be more in the spirit of Amateur radio. My 250-watter claims to work on "all amateur bands". It plus a Yaesu FT-817 otta be FB if that were true and who knows? Maybe I'll dig them out, QRP my Kenwood and find out. Isn't that what amateur radio's all about?

re: wtb Motorola 900Mhz equipment for amateur radio

Hi there,

I'm trying to find a fair price on a Motorola GTX 900 radio that I will move to the Amateur Band. If you have one that will do at least some conventional along with you old trunking system, please drop me a note if you want to sell or trade it off.

Please provide me with the model number and you offer price when you use the Email address below.

I'm also interested in talking with anyone who has converted gear on 900 and how you like it.

thanks, use the Email address below to avoid the spam filter.

cheers

Gerard is the greatest!
Gerard je bent geweldig!

Took the whole thing apart, upside down, but everything connected...
(I risked my life, I know)
Then 1 h of trial and error, and Gerard was right: a yellow capacitor,
5000 pF, 500V~ was the short and had blown another resistor,
somewhere deep down in the radio. Don't ask me how I found out
it was a 47 Ohm; it was black and I had to measure a piece
of copper wire from it.....
I mounted an old capacitor of 10 nF from the old box I never wanted
to throw away, and a near-to 47 Ohm resistor.
The radio is playing again!
(Looks a lot like Gerard's Saba Wildbad 125 Table top on
http://www.cs.uu.nl/~gerard/RadioCorner/, but has round
speakers and a "magic eye")

Thanks to all of you on usefullnet, specially to Gerard himself.

WHAT rig are you trying to drive it with? You DID connect a relay keying line to the amp I hope -
and in the case of many late model rigs, the amp keying function must be activated via a setup menu
in the transceiver...

Greetings....just purchased a 2002 Toyota Tundra pickup. Installed an FT900 and the ATAS 100 antenna. Everything works great, except the level of ignition noise on 40 mtrs. No problem on any other bands that I use, just 40. Any suggestions on how to decrease or eliminate the ignition noise? We know its not the fuel pump so that was a plus! I've ran about six braided ground straps to different parts of the frame and body, a little difference but not much. Thanks & 73...

On the best, the xmit audio is very tinny and cheap sounding, on some,it's so bad, people can't even tell it's you. They're cheap for a reason, there is no fix. Many have been returned. Yaesu really screwed up on this one. Their FT-2600 is also poor but acceptable. Their little FT-90 sounds good.

I have had the FT-1500 for about a year now. It has performed very well. Transmit and received audio is very good. I have not experienced excessive heat build-up from the unit. I have it mounted with 3m supermount velcro strips with very good results. Overall I am very happy with the rig. It was a good choice for the very small mounting area I had in my 2000 Blazer. You should be happy with the rig.

Hi All ,
I hope this is the right newsgroup. I was asked to help clear the loft of a friend who was into amateur radio in the 1950's.
Amongst this collection was the above. It aught to go to someone that can use it. Unfortunately it weighs about 6olbs and is in Cent S. UK.
Would appreciate hearing from enthusiasts as to its value and or use.
Bit of a museum piece. Digital image available on request. Buyer will have to collect or pay shipping/ packing to wherever. .

Well!

Assuming the heritage HTX-400 takes from Maycom MH 465 and the fact
that Cherokee's FR-465+ and FR-467 battery compartment could be fitted
to this rig with no problem (7.2V - 1 Watt ERP) I would still like to
try it as ambulance com. Even with battery compartment changes it is a
very tiny unit sizewise...

Sorry if these items are a little off topic, but I know that a lot of guys into ham radio and electronics may also have an interest in these kind of items:

I have for auction on ebay a B&K TV Tester, that is currently at $1:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1013677222

I also have for auction a TV Rejuvenator that can brighten dim picture tubes:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1013679879

For more pictures and info on these items, you can also take a look at my personal web-page:

http://i8mtm2.tripod.com/richardsjunk

Thanks for looking!
~Richard

4105. Ham-M Mod Questions

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-04 17:08:14 UTC
From: ai928@FreeNet.Carleton.CA
Message-ID: <9pi51u$i6q$1@freenet9.carleton.ca>
Source record: 53809
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

Hi.

Just yesterday, I bought myself a TA-33Jr and a Ham-M rotator (all used, of course :-). I plan to mount these on a small 32' TV tower. I plan to add some guy wires to the tower.

After reading a few items about the Ham-M, I want to maybe modify it a bit, and am wondering if I am on the right track. Any help or advice about the following would be appreciated. This rotator has the old brown control box (bakelite?) with the single lever switch.

Should the following modifications work okay? Is there any pit-fall or possible problem of which I need to be made aware? Has anyone else done any mods like these?

My understanding of the control circuitry is as follows. The single lever switch for this controller has, I understand, five positions, with the middle position being the neutral "Off" position. The left and right "inner" positions energise the meter circuit, to allow the user to read the position without turning the rotator. The left and right "outer" positions continue to energise the meter circuit and, as well, energises the motor/brake circuit, with the motor windings phased (by the capacitor) for the required direction.

First, I would like to modify the control box to add an overall toggle "power" switch after the fuse in the power line. Then I would like to move the meter circuit transformer primary's switch connection from the lever switch to the power switch. This way, the meter circuit is always active when the control box is turned on by the new toggle switch; no need to press the lever switch to read the rotator position.

Secondly, I would like to add an "immediate calibrate" mod, by adding a N.C. push-button switch between the meter input resistor network and ground. Pushing this button would then effectively disconnect the rotator pot's wiper arm, so that the meter immediately goes to full scale deflection (without having to turn the rotator). This would allow one to adjust the meter scale calibration more easily, without moving the antenna.

Thirdly, I would like to re-wire the primary of the motor/brake transformer so that it will be energised from the lever switch's "inner" positions as well as the outer positions. This would

effectively add a simple brake delay by energising the brake solenoid with the lever in the "inner" positions. To actually turn the rotator, the lever switch would still have to actually go to the outer positions, to energise the motor windings in the rotator. The user would then move the lever switch "in a bit" to de-energise the motor and allow rotation to stop (or at least slow down enough) to then let go all the way and allow the brake wedge to lock the rotator. WOULD THIS ALLOW NOT HAVING TO ADD A "TORTION BAR" TO THE TOWER AS ROCOMMENDED IN THE HAM-M MANUAL?

Finally, I have read somewhere that the original meter circuit can be quite inaccurate due to mains voltage fluctuations on the primary of the meter circuit transformer. So, I would like to add some kind of voltage regulation on the secondary side of the meter circuit transformer. DOES ANYONE HAVE ANY RECOMMENDATION FOR THIS? IS THERE A "TRIED-AND-TRUE" MODIFICATION TO DO THIS?

Are there any other simple mods that I should add to the Ham-M rotator?

Oh, and one other question: is there any freeware and/or articles available on the net to add home-brewed computer control to the Ham-M? (I.e. to build my own control I/F circuit and run freeware to control it?)

And another question. I am new to using beam antennae. In high winds and stormy conditions, is it better to aim the boom of the antenna into the wind (so the elements bear the brunt of the wind), or is it better to aim the boom broadside to the wind (so the elements are aligned with the wind direction)? Does it really matter anyway (since the wind can unexpectedly shift)? Is there, perhaps, automated control mods or circuits available to automatically aim the antenna during high wind conditions (i.e. to move the antenna with the wind direction)?

Anyone know the color coding of the Yaesu MH-27 hand mike? I know what the pin-outs are on on the RJ-45 plug, but do not know which wires go where. I got a FT-2500 and the mike, but the plug was cut off for some reason. (Yep, I took the mic apart and all the wires go into traces on the circuit board, but I am unable to confirm them.)

Or, I would like to know if someone has an MH-27 for sale?

Thanks,

Bob - K9YH

Source record: 53818

Try this:

1) Make sure your antenna is far away from the engine and
properly grounded along with the tuner and you have 95%+
shielded coax routed away from vehicle wiring and factory
quality installation of the connectors. You can tell if it is coming
from the coax if you remove the antenna and still hear it.

2) The cheapest thing to try is to wrap the distributor cap (right over
the wires) in tinfoil. You can wrap a little under the bottom edge
and screw the cap down to make contact to ground.

3) Grounding the hood at the hinges and finger stock at the front
should help too.

4) Ground the exhaust system. This isn't easy and might not last
forever. Water pipe clamps on the hanger hooks or stainless clamps.

5) You might also look into Magnecore plug wires. (on the web)

Once you get your ignition noise down then you start noticing
every other car on the road...

4117. Advice on compact HF with auto ant tuner

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-05 00:53:06 UTC
From: Jonathan Bhatia <jbhatia@yahoo.com>
Message-ID: <Sv7v7.74893$707.39744729@news2.rdc2.tx.home.com>
Source record: 53821

It has been about 7 years since I was active in amateur radio. Other aspects of my life (college, work, etc) have left little time for my ham radio hobby.

Flipping through a couple of magazines/websites, I am amazed by the new radios. I would like to get back into it and would like to find a compact HF radio with an automatic tuner. I remember using a Yaesu 757 which was great, but had an external (MFJ) tuner, etc, and required tuning anytime you switched bands. I am looking for something simple to operate and configure. I am in an apartment, but am on the top floor, so I could put a small whip style antenna on the roof without a problem. I am not looking to transmit 1500 watts, I just want to make a few contacts. I am looking for something small, but that will allow me to transmit on 10-12-15-17-20-40 meters. If it had 2m or 440, that would be even better. What are the popular models now? What about on the used market?

Thanks for your advice.

The antenna tuners built into the rigs generally have a rather limited range. If you put up something like a trapped vertical or a trapped dipole that presents a fairly close match then the tuner will work okay. They are not good for feeding a simple whip. You might want to take a look at the SGC line of tuners. They are designed to be placed outside and work with an end feed wire or whip antenna to provide a good match on all bands. With any end feed wire or whip you will need a ground (radials or perhaps building steel).

IC-706 Mark whatever for the last latest model. Definite best to get.

A 'whip' will not do all that well, regardless.

But I believe it is the best for the bux out there with what ur looking for.

Dennis, thanks for your follow-up, but ...
never mind.

I investigated the control box this evening, and I now see why
none of what I wanted to do will work:

1. the motor winding circuit is connected by the lever switch
before the motor/brake transformer primary (and this is
probably a good thing, to reduce arcing at the switch for
motor windings, but it will not allow me to implement a
"manual brake delay" using the lever switch, as written in
my original newsgroup post) :-(

2. the trim-pot cannot be disconnected from ground (for the
"instant" meter calibration mod), since it is riveted
onto the chassis :-(

Oh, well, if anyone has any thoughts or ideas on how to
implement "instant" meter calibration or a "manual" brake delay,
please let me know. Also I would still like to know how to
implement a regulator for the meter circuit.

RE: Ham M Rotor

Reply
by WA8RUO on November 17, 2000
Mail this to
a friend!
Patrick,
The info that K0RS gave you is right on the money.
I remember "back
then" that there were some "brake delay modules"
being sold that
would lessen the wear and tear on the rotor. I
opted for the "poor man's
version"... a manual miniture toggle switch. As I
recall, de-energizing
the brake also turned on the panel light... a neat
little reminder that the
brake was de-energized.
If you are interested in thid mod, let me know.
73, Charlie

I notice you're using a TA33Jr so really that brake elimination may work out just fine. As for regulating the readout, thats a tough one. My Ham-m meter wandered a bit but I really didn't find it objectionable...nothing more than about 1/8" IIRC. If yours is moving much more than that, there may be a different problem.
-Bill WX4A

It's awfully hard to recommend any one rig. But if you're just getting back into
the hobby, there are a few places you can go on the web.

You might want to subscribe to QST -- that will give you access to the Members
Only portion of the site, http://www.arrl.org where you can access all of their
product reviews, which have all been archived, going back to the early 1980s.

For a free site, try http://www.eham.net/ and double click on "product reviews"
for user feedback on practically any rig.

For used stuff, try the rec.radio.swap newsgroup, or go to
http://listings.ebay.com/aw/listings/list/all/category4670/index.html for all of
the ham listings on ebay.

All of the major makers also have web sites with specs on their rigs -- Icom,
Yaesu, Kenwood, Alinco, etc...

Good luck!

Automatic tuners built into modern transceivers can cope with an SWR as big as 3:1 This is usually stated in transeiver operating manuals.

Or it may be defined in terms of the length of antenna wire. For example, the handbook may say the automatic tuner will work OK provided the antenna end-fed wire length is more than 30 feet on the 80 meter band. This means it will work on all higher frequencies with that or shorter lengths.

The automatic tuners stop working because the internal tuner capacitance is not large enough and the internal tuner inductance is not large enough AT THE LOWEST FREQUENCIES. There's just not enough room inside the box to accommodate them.

But don't worry too much about it. Just provide some external assistance. The operating frequency range can be extended downwards by adding a bottom loading coil to a short antenna. Inductance value is not critical. The antenna need not be made resonant.

If the loading coil is made too big it might prevent the internal tuner from working at higher frequencies.

Matters can also be improved by NOT end-feeding an antenna which is an exact 1/2-wave and so have an extremely high feedpoint impedance presented to the transceiver.

The important thing to note is that you don't need an all-singing, all-dancing, bells and whistles manual tuner if you already have an automatic tuner built in. They are excellent within their not very restrictive limitations. Just a small external fixed coil may be all that's necessary to bring your desired lowest frequency band, usually 160 or 80m, into range of the ATU. There's never any problems with 7 MHz and above.

Built-in automatic tuners will onviously cater for the peak power output of the associated transmitter. This is usually 100-120 watts. They are excellent for rapid, convenient, band changing with random length antennas. I am just a user. I have no commercial connections whatsoever. Never had any.

If you intend to install a vertical whip mounted on the roof or chimney, just use a length of insulated wire (absolutely no coax) to connect it to the transceiver and it will fall into the category of an all-band random wire !

Jonathon, welcome back to the bands !

Regards, Reg, G4FGQ

Reg, are you saying that a random wire antenna will have an SWR under 3:1 on all bands and that you can get a good match to it with the built-in tuner on most transceivers? I would think that you would have to have and adjustable inductance (or capacitance depending on the antenna length) and that you would need to set for each band to get the impedance within range of the tuner. I've not had much luck with random wires on the built-in tuners.

TUBES FOR LINEAR AMPLIFIERS USING 811A.

Stay away from Cetron 811A's. Out of three the plate caps have come off of two. They are not bonded very good. Spend a little more money and buy Svetlana 572B's, they are built like Russian Tanks. The Svetlana 572B is a direct replacement for the 811A in all cases except the Yaesu FL-2100 series of linear amps.

Bob,

I don't have the MH-27, but I do have the MH-36B.

I am not sure how they differ, but mine has a 6-conductor RJ-12 (looks alot like RJ-45, but with six conductors instead of 8)

Here are the colors, as viewed with the front of the plug (the end that gets inserted first) from left to right.

Green, Gray, Red, Brown?, White, Blue

de Lance, KJ5O

A nice radio that isn't one of the tiny "subcompact" rigs but has a small footprint, a good tuner, and nice recvr. is the Icom 737, these are a pretty good value for HF only with built in tuner.

The tower shouldn't be any problem - whatever is convient for the rotor, twisting coax cables, etc. - a couple of feet perhaps. Being only 8-feet above the roof could be a problem depending on what types of conductive materials are in the vacinity - aluminum gutters, flashing, electrical wiring inside the attic, etc. The 2M beam should be at least 3-feet (1/2 wavelength) above the HF antenna.

==========
I am not saying all antenna wires will have an SWR under 3:1 on all bands. But I will admit there's an element of luck in finding one that is.

Suppose we have an end fed wire, fed against a ground of some sort. A poor ground is best. If the problem occurs it will occur nearly always on the lowest bands because the antenna wire is not long enough. Its capacitative reactance is too high so load it with a coil big enough to bring the reactance down to something the automatic tuner can cope with. This does not always work because the input resistance may still be too low. Remove the coil for higher frequencies.

At higher frequencies cut the antenna length such that it is not an end fed half-wave on any band.

Avoid using a coax line between the end of a random wire and the transceiver or the impedance presented to the tuner will look nothing like any real antenna of any length. On the lower freqs it acts like a lump of capacitance. If you MUST use coax the unwanted capacitance can be tuned out with a coil shunted across it. This will also transform a low resistance antenna to a higher value within range of the tuner.

Try connecting L and C in shunt with the antenna as well as in series.

As you say a variable component is better than a fixed one. So a boxfull of home brew coils of various values is handy.

I suppose sooner or later the awkward case will arise - one external component will not do the job and two components constitute a tuner. I must have been lucky. I've had 3 auto-ATUs in my time with a variety of random length wires. Don't recollect having any trouble except on 160 and 80m. The 80m problems have been cured by changing antenna length without adversely affecting any other bands.

On 160m a shortish antenna, say less than 70 feet, with a good ground will have an input impedance which looks like a capacitor in series with a low value resistance. But by connecting a coil in parallel with the antenna it can be made to look like a much higher resistance, whereas a series coil is of no use. But to exactly resonate the short antenna with the shunt coil may overdo it.

Also on 160m, a wire longer than about 1/3-wave will have a high inductive reactance with a fairly high resistance in series. A series capacitor will still leave the high resistance. If the auto tuner can't cope then, again, a shunt coil may perform the trick.

Try to visualise what the auto tuner is being presented with and then make life easier for it.

On 10m there may be problems due to stray capacitance and inductance which are impossible to analyse. In those circumstances just do something drastic like cutting 1 or 2 feet off the antenna and hope for the best. If that doesn't work add 3 feet back on. Changing the length of the ground connection is another ploy you can try at the higher frequencies. Keep trying.

I successfully replaced the battery cells in the pack for my RS HTX
202 with new ones. Luckily, the 202's pack comes apart easily. It's
held together with small Phillips screws. There's a good article in
the Jan. 2000 CQ magazine on this procedure.

Yep, I was looking for solid state amp designs/kits, etc, the other night and stumbled across his website. I read the claims and fcc replies etc that he posted on his site. Actually, to be fair to all the others that have to go though the same thing, I have to agree with the fcc on this one. I get the impression that the guy thinks that because a ham only buys one of his amps in a years time, that makes it legal for him to sell ???? number of amps a year, providing that each is to a different ham. Dunno, but I think thats another way of distorting the wording of the rules to fit your program. The rules state you can only sell one of each type amp a year. So you could sell one HF amp, one VHF amp etc, and that would be it. It doesn't matter how many the buyer buys in a year. Only the seller. I think the answer to all this is to sell kits/parts only and let the hams build them. Also require a ham ticket to buy one that is capable of working CB. But I also see other companies selling amps that may not be certified. I think if the fcc is going to shut down some, they should shut down all of them to be fair. Also the fcc should provide for a easier method of getting certification for these amateur amps. Seems to me the process must be a royal PIA being not many do it except the big companies. MK

> Jack, W7EJJ

Dunno, I have to kind of disagree with that assumming normal tube
values. The 572 really needs a higher plate voltage than the 811a's.
I've heard of many people having problems with parasitics, and excess
oscillation problems using 572b's with the lower voltages that most
811 amps use. If I had an 811 amp, I'd stay with 811's unless you can
cough up 2400 volts. Thats what the 572's like to have . Most 811 amps
run 1800 volts or less. Just my 3 cents...BTW, I thought cetron went
out of biz long ago...Did they crank up again??? I still have a set of
old cetron 572's in a sb-200. They made good 572's back in those days.
Dunno about the 811's... Didn't know they made them. I had thought
most people were using the Svetlana 811's in 811 amps?? Did they quit
making 811's? MK

Disclaimer: I used to be a ham, but am still an avid RF experimenter for
receive only. If I wanted to transmit, I would have a license.

I'd like to know the reason for the rules about the ham kits... Is this
to avoid people using the amps as CB power amps? It seems like tinkering,
in the sense of building partially built kits ENCOURAGES the technical
side of the ham hobby????

The only real reason (other than the CB diversion issue) might be to avoid
the problems of lots of semi-competently built ham equipment????

Frankly, I admire the ham radio hobby, and always thought that maybe 1/4
of it was the technical side of things (of course, it has public service and
social aspects also -- and I was usually too busy when young to deal with
the social side of things.)

I would really like to see more electronics tinkering nowadays -- computers
and stuff like that have seemed to have grabbed alot of the tinkering mindshare
(I was partially a victim of that in the 1970's).

All this said -- the rules are the rules, and they must be even handedly administered.
I agree with the enforcement, but just wonder about the reasoning for the rules.

John

Source record: 53773

It is one of the many 'feel good' rules and laws. Yes, it is to keep
people from using them on the CB band. Around 1972 give or take a few
years there was a big boom in the CB usage and it seems that there was
CB operator in almost every block. With the unfiltered amps and high
power of the illegal amps the FCC was getting complaints from all over.
They therefore passed a law to make the amps illegal if they operated
from about 25 to 50 mhz. It is about as good as the law that was passed
a few years ago to keep people from receiving the cell phone calls.

Source record: 53774

The most common way is to take a so239/pl259 type T connector and unscrew the male center pin. If you do not get enough signal with the pin removed you cam put a short screw in the place of the center pin but make sure there is an air gap between it and the female connection that you screw it into.

The object is to have a section of line that does not upset the SWR but provides a way to inject a signal without getting too much transmitted power back into the signal generator. Most signal generators will only stand from 10 to 100 miliwatts going back into them so you want a big loss in the connection. Somewhere around 50 to 70 db depending on the power of the transmitter.

4171. Help! Kenwood TS-930 Guru Needed

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-06 12:33:37 UTC
From: jml@satx.rr.com
Message-ID: <3bbef618.4691438@news-server.satx.rr.com>
Source record: 53775

I bought a No.1213 .250 Irad filter 88H250A. It has a center freq
of 8830.
On the International Radio page, it shows this item useable on both
the TS-940, and the TS-930.
My question is, how is it used on the TS-930? Where and how is it
installed? How is it selected for use?. Do I simply replace the .500
with the .250?
My 930 has the normal SB xtal, a .500 Trio, and the AM position has
only what looks like a tuned circuit on it.
I've actually abandoned the idea of installing it, since I can't get
the 930 running, but I'd really like to know the information. Is the
TS-930 more or less restricted to only the 3 filter slots?
Any help would be great!. James W5LWU

From: "Edward A. Feustel" <feustel@erols.com>
Message-ID: <9pnbb8$1kg$1@bob.news.rcn.net>
Source record: 53780

The 930 has two 2.7 kc filters built in, one at 8830 and the other at 455.
Slope tuning works when in SSB
if you have no other filters.

It has space for three optional filters, an AM filter at 8830, a CW filter
at 8830, and a CW filter at 455.
The filter at 455 can be either .5kc or .25kc.

The filter installation instructions are on page 30 and 31 of the manual.

Good luck,
Ed, N5EI

Kantronics Multimode Controller KAM '98. For a description of features,
see

http://www.kantronics.com/uhfvhfhf.htm

Unit is in excellent condition. Very recent version (8.3). Non-smoker.
Bought about 6 months ago for $399, but I need to finance a TM-D700A, which
already has a TNC built-in, so I won't need the KAM '98 any more.

Asking $275 + 7 S&H (priority insured)

Reply to rjchen@stanford.edu if interested.

4181. HF Transceiver vs Drake R8B Comparisons??

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-06 19:38:45 UTC
From: Stephen Silberman <silber@rcn.com>
Message-ID: <9pnml5lc1@bob.news.rcn.net>
Source record: 53784

Hi

Just passed an exam to get a Ham license. I'm planning on getting a transceiver for high frequency contacts. Up to now I've been a SWL using a Drake R8B. I'm wondering what rigs might be comparable on the receiving end to the Drake!

I guess the question is how much do I need spend on a transceiver to equal the Drake's capability. I'm mostly a DX listener so I'm willing to give up a bit of audio quality as long as inteligibility doesn't suffer.

Thanks,

Steve Silberman

4182. FT-100D Question

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-06 19:57:34 UTC
From: Mark Langberg <mlangberg@mediaone.net>
Message-ID: <OmJv7.36569$kH1.327317@typhoon.mw.mediaone.net>
Source record: 53786

I just got my FT-100D back from Yaesu repair (it wasn't autotuning or manual tuning with the ATAS 100 antenna) and it is behaving differently than before.
Now, after I power on if I tune via the large tuning knob it immediately goes into "locked dial" mode (the "lock" icon appears). I can disable the lock by pressing the lock button and then it of course works fine.
Before I sent it to Yaesu, however, after I powered up it would tune without me having to press the lock button to unlock it. Yaesu says having to disable the lock function each time it is powered up is normal and the default, but it is an extra step and annoying.
My question is, is this normal for FT-100D's? Does everyone have to unlock the tuning dial each time it is powered up? Help!
Thanks in advance for your advise.

I recently bought for $10 an IBM Thinkpad 750 laptop at a hamfest. I bought it for operating digital modes (PSK-31, RTTY, etc.).

It is a 50 MHz 486 wtih 8MB of RAM, 350 MB of hard drive space, and a mono display. One of my fellow club members thinks that I need at least a low-end Pentium. Should I keep this laptop or get rid of it? If I should get rid of it, how much can it fetch?

>
>Jason Hsu, AG4DG
>jason_hsu_802701@@@yahoo.com

You best bet would be to pick out some of the software you want to run on it, and see what the minimum computing requirements are. Your laptop is probably of an early 90s or late 80s vintage, and some of the digital ham software of that era will do just fine on it, I'm sure. But later software is going to be iffy, at best. You also need to look at your video memory/video card; that was the biggest bottleneck to early Windows programs; no matter how fast the processor was, everything could get clogged down in video processing. You'd probably be best off looking at MS-DOS software; I can't imagine Windows stuff being happy on 8 mbytes of ram. (If it helps you to date your pc, I bought a 120 mhz pentium in the summer of 1994 -- you were probably in grade school or something :-)

Source record: 53791

Cetron's are not made any more, but some suppliers have a big stock of
them left over (or bought them surplus).
Svetlana says use the 572B in place of the 811A. I can only assume from
this that they will not make any more 811A's. BTW you cannot find anybody
with Svetlana 811A's in stock.
RF Parts Co. also recommends Svetlana 572B's as a replacement for
811A's. Go to their website and they have much info on using 572B's in place
of 811A's. www.rfparts.com
Only 811A amps that will not take 572B's direct is the Yaesu FL-2100
series, but Svetlana has a Technical Bulletin on how to modify the Yaesu
FL-2100 series so you can use the 572B's. The Yaesu FL-2100 series of amp
will go into oscillation that is the reason for the Tech. Bulletin on how to
modify.
The 572B's operate great at 1.5 KV and just loaf along at 600 watts for
the AL-811 which has 3 tubes, they also work great in the AL-811H which has
4 tubes.

Hi Steve:
Keep the Drake R8B and put it on a 150 foot or more longwire. Use it when
the transceiver can't hack it.
Make sure the long wire is at 90 degrees to your transmit antenna and
away from it. Use a external relay to mute the Drake and at the same time
ground the longwire while transmitting (and key the amp. if you have one).
This is the setup I use with the exception I'm using a Japan Radio Co.
NRD-545 DSP receiver instead of your Drake,which either the Drake or the JRC
is far superior to any transceiver for really digging out the weak signals.

Any idea where I might get a manual or schemetic for this?
It appears to have been a very late (1970?) model-at least QST reviewed it then.
I've checked with the larger vendors and SAM's but so far no luck.
If you've got one, I'll pay for copying and sending it.
Thanks
Mike

I also have had both of these rigs. They are both very good. The TR7 can be improved a bit, if you replace the 1N4148 diodes that are used in the 2nd mixer, and in the Translater mixer, with matched HP1N5711 hot carrier diodes. I did this with one of my TR7s, and the MDS improved from .15uV to .07uV.

If it has a sound card it should work psk31. I used a 486dx/2 desktop
and it ran the origional psk31 program under windows 3.11. It only had
8 meg of ram .

Go here for some programs and the requirements to run them.

http://www.muenster.de/%7Ewelp/sb.htm

I doubt that you can run any of the win 95 and 98 programs on it but it
should run the win 3.1 and dos programs.

4197. FS: IC-706MKIIG, $675

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-07 05:27:27 UTC
From: Robert Joshua Chen <rjchen@Stanford.EDU>
Message-ID: <9pop3vecu1@usenet.Stanford.EDU>
Source record: 53701

Icom IC-706MKIIG Base/Mobile Transceiver. Excellent condition. Non-smoker. For a full description plus accessories available, visit icomamerica.com. User reviews can be found at http://www.eham.net/reviews/detail/63.

Bought in April of last year. I've ended up doing mostly VHF/UHF with it, so I've decided to sell the Icom and make room for a dedicated VHF/UHF radio. That, and the fact that I just got a letter from the condo management people, telling me to remove all the "metal structures" on my balcony (the VHF/UHF antennas I can still hide fortunately). So, I'm going to put off HF until I move somewhere better, at which point I'll buy a dedicated HF radio.

I've seen the 706MKIIG for $869 new so I'm going to ask for $675 + 15 shipping (priority insured; it's heavy and expensive) and hope that is a reasonable price.

Also, I have available the DTMF mic (HM118) and 3 meter separation cable (OPC581) that I really must sell along with the radio (as they will do me no good without the radio). For those who might want just the radio itself, let me just say these two accessories are really very useful, and I'll only ask for an additional $50 for both (worth $120). Also in excellent condition by the way.

Thanks for reading and email rjchen@stanford.edu if interested.

Looking to buy any Eddystone radio equipment for my collection.
Prefer items in good condition but will consider anything. I will
always pay the best price and collect anywhere in the UK, (will buy
from overseas also). Turn that old item gathering dust in the garage
or attic into money!

As well as receivers, I am interested in panadaptors and accessories
such as loudspeakers (round or oblong), S meters and spares. Also any
old documentation etc.

I am especially interested in finding a synchroniser (synthesiser) for
my 1990R.

Just let me know what you have available and I will give you a price.

73 de Steve

I have an Icom 735 transceiver, which cost about $1100 new (back in the 80s), and it's general receiver is a little hotter than a JRC NRD525 receiver, which I bought back around 1988, and should be comparable to your Drake. However, the JRC has wider filters for AM than the Icom does -- it can receive at 1.8, 2.8, 6, and 12 Khz, so it can provide better audio.

Just about any newer generation of transceiver should be more than comparable to your Drake, even the less expensive transceivers, like an Icom 718. Just make sure your transceiver has at least 6 khz of bandwidth in the AM position. Also, no transceiver I know of has any kind of "synchonious" tuning for AM, so you're going to have to give that up, or maybe look at the outboard Sherwood unit.

I think you'll also find that practically any hf ham antenna will be more than adequate for shortwave listening.

Good luck!

Bob

The Courier and Thunderbolt amplifiers were made by E.F.Johnson before 11 meters was given to CB. I had a Courier for a while.

They are tube amplifiers intended for Class C (I think, maybe Class B) operation. As I recall, the Courier could run a few hundred Watts input; the Thunderbolt somewhat more, both well within legal limits. They covered 10 through 80 meters.

Today their best use would be to raise the output of a small CW rig to a serious level.

I believe they date to around 1960.

73, Bob K6DDX

I always forget something when I post. Let me just add some info to answer some of the questions I got.

1. I have the original box plus instruction manuals.
2. The DTMF mic allows you to access certain repeater functions - such as autopatch, signal strength checks, remote control, etc. Very useful, but mostly for VHF/UHF. The separation cable allows you to remove the detachable faceplate from the main radio body (useful in mobile mounting, but also in fixed station use).
3. I really would like to sell everything together, i.e. for a total of 725 +15 S&H.

Thanks,
-Robert KG6CFZ

While the Thunderbolt could be confused with the Johnson Thunderbolt, I doubt this one is the Johnson one. YOu did not give enough details for it. If is the Johnson one, then look here.

http://bama.sbc.edu/

Johnson also made a Courier modle but it is not a moble unit.

The Courier Mobile sounds like the one made for the business band around 30 mhz and was used by many CB operators. Courier was a big name in the comercial (well not really that big) and a bigger name in the CB market in the mid 1960s.
Should putout about 50 to 60 watts when driven by about 4 watts. Think it has a black front with a light that comes on when it is transmitting but not sure.

4226. Help with FT-100D?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-08 00:50:54 UTC
From: Mark Langberg <mlangberg@mediaone.net>
Message-ID: <OL6w7.40930$kH1.366523@typhoon.mw.mediaone.net>
Source record: 53731

I just got my FT-100D back from Yaesu repair (it wasn't autotuning or manual tuning with the ATAS 100 antenna) and it is behaving differently than before.
Now, after I power on if I tune via the large tuning knob it immediately goes into "locked dial" mode (the "lock" icon appears). I can disable the lock by pressing the lock button and then it of course works fine.
Before I sent it to Yaesu, however, after I powered up it would tune without me having to press the lock button to unlock it. Yaesu says having to disable the lock function each time it is powered up is normal and the default, but it is an extra step and annoying.
My question is, is this normal for FT-100D's? Does everyone have to unlock the tuning dial each time it is powered up? Help!
Thanks in advance for your advise.
Mark Langberg KC80WF

YOu might as well look for any old computer. Almost any computer will run a terminal program. It does not have to be a packet specific program, just any terminal program. You should be able to find one for almost nothing at a hamfest or just ask around the local hams.

I need the connectors for the BC-669-D transmitter. I will accept either the connectors or the whole cables. The pins used are 7, 10 and 11 pin Amp. type. Used connectors that are whole are fine. I can make the cables up if necessary.

4229. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-08 05:30:33 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <9prdlp$c8s$1@news.hawaii.edu>
Source record: 53734
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefaced
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

I have a radio for sale, it's a motorola Astro, model is
T99DX+138W_ASTRO with remote control head model 9000, it is
alpha-numeric display, can be programmed through software, works very
well, I have all data cable and mounting brackets for it. It looks brand

new.

Price is negociable, feel free to send in offers.

For any further info, feel free to contact me.

Thanks

Marc

I believe GIM in this case stands for "gimmick", and old term for a capacitor made by twisting two wires together, or putting them in close proximity to each other.. which creates a very low capacitance coupling. The capacitor was most likely made by putting two wires next to each other on one side of some kind of insulator.. a 0.5 pF disk capacitor should work fine for this purpose.

Either that, or just check the Yellow Pages for shops that reburbish old PCs. Some of the stuff that gets donated to them is too old to even fix up and sell, and they may not have storage space for it -- and they're ready to give it away for next to nothing.

Source record: 53745

Two receivers for sale: At present, both are from an estate and have
been sitting for several years. Neither are checked and are sold
as-is at these prices:

1. Hammarlund SP-600 receiver, appears complete, was told it works
but don't plan on it. Front panel looks pretty clean and will
probably compound/wax out nicely, knobs are original, some corrosion
on chassis (can be cleaned up), original meter and knobs, has crystal
deck, manual, rack mounted, $290.

2, Hammarlund HQ-170, with clock, has the noise blanker, very clean
front panel, original knobs, nice cabinet with original paint, may or
amy not work, $150.

3. Hammarlund HQ-129X, good front panel, cabinet is wrong color, knobs
probably aren't original but look good, may or may not work, manual,
$85.

KEPCO MST Triple-Output Power Supply, 0-55v, 0-3.5A, GPIB, RS-232,
NICE!

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1645808801

Auction Ends: Oct-10-01 13:35:51 PDT

You will be bidding on a Kepco triple-output power supply. Each output can deliver 0-55 volts DC and 0-3.5 Amps DC. Each output has digital voltage and current meters. This unit looks like it's in great shape and ready to go to work. And it is a current Kepco product. (Click on the link above, for details, many photos with close-ups, and links to Kepco's sites with specs, etc.)

Everything is intact, and in very good to almost new condition. There is no physical damage that I can see, except for very minor signs of normal wear and tear.

This rack-mountable unit consists of three Kepco 200-Watt MST 55-3.5M power supply modules, one Kepco MST 488-27 controller, and one Kepco RA 55 9-slot mainframe.

These products are still available from Kepco. Kepco's current list price for EACH of the three MST 55-3.5M power supply modules is $1,765. Kepco's price for the MST 488-27 controller is $1,395. Kepco's price for the RA-55 mainframe is $695. That's a total current list price of $7,385, for this unit!

And the starting bid price is only $199...

Guaranteed to be not DOA. 10-day right-of-return if DOA, with refund of bid amount.

I accept credit cards through PayPal and BidPay, as well as personal and company checks, money orders, and cashiers' checks. Worldwide shipping. I try to ship all orders within zero to one day of receipt of payment.

I also have LOTS of other GOOD USED ELECTRONIC TEST EQUIPMENT for sale, at:

http://www.fullnet.com/u/tomg/gooteesu.htm

(I have mainly Tektronix and HP, but also lots of others;
oscilloscopes, probes, plug-ins, signal and function generators, power

supplies, spectrum analyzers, frequency counters, voltmeters, ammeters, ohmeters, multimeters, SWR meters, decade resistors, distortion analyzers, variable capacitors and inductors, curve tracers, xy plotters, chart recorders, tube testers, and much, much more... hundreds of units... all tested before being sold and all reasonably priced.)

Thanks!

Tom Gootee, tomg@fullnet.com

Your substitution will depend on the needs of the circuit. You
don't mention what kind of circuit or the function of this cap or
why it burned up (overvolt, overcurrent, short?).

Gimmicks are used in situations where the required value was
very small but critical and arrived at experimentally, usually for
feedback, coupling or tuning in RF circuits like the SB-102
neutralizing "wire", or TV/FM broadcast tuners. It may be
easier to twist your own out of #24 phone wire or wirewrap wire
and trim to size rather than trying to find a fixed value over the
counter.

Dave

I too just recently got a IC-718 too and I do not have any problems with scratchy or choppy sigs. The recieve is very clear unless I have the variable noise blanker crancked up real high. I have the UT-106 in my rig and seems to work ok but not great. The NR feature can help to knock down the noise floor a bit, but just like the noise blanker, if its turned up too high it can degrade an incoming signal.

Dear All,
I could also do with a manual for this generator. So, if anyone can
scan at least the circuit, ideally the whole thing, I would be extremely
grateful.

regards

Robin Birch

4253. FS: Two SERVICE MANUALS for AUL SG-1144/U Signal Generator

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-08 21:24:13 UTC
From: tomg@fullnet.com
Message-ID: <11915d6.0110081324.5167f70e@posting.google.com>
Source record: 53657

Two SERVICE MANUALS for AUL SG-1144/U Signal Generator: $15

I have for sale two different SERVICE MANUALS for the AUL Instruments, Inc. SG-1144/U Signal Generator, on a CD-ROM disk.

One manual is 241 pages and the other is 136 pages. They contain just about everything you'd ever need to know about using and maintaining the SG-1144/U.
They are in Adobe Acrobat format PDF files. One of the files is 5.873 MB (megabytes) and one is 1.539 MB. The files are read using the free, downloadable Adobe Acrobat reader. They can also be printed. They are searchable, and are hypertext-linked, so they're very easy to get around in. Acrobat even lets you magnify things, which could be great, if your eyes are getting bad.

Here is the text from the cover of the 241-page manual:

"TM 11-6625-2954-14&P,
TECHNICAL MANUAL,
OPERATOR'S, ORGANIZATIONAL, DIRECT SUPPORT AND
GENERAL SUPPORT MAINTENANCE MANUAL
FOR
SIGNAL GENERATOR SG-1144/U
(NSN 6625-01-075-8478)"

"This copy is a reprint which includes current pages
from Changes 1 and 2. Title was changed by Change 2.
HEADQUARTERS, DEPARTMENT OF THE ARMY
30 JANUARY 1980 "

And here are the chapter titles from the manual:

SERVICE UPON RECEIPT AND INSTALLATION

OPERATING INSTRUCTIONS

OPERATOR/CREW MAINTENANCE

ORGANIZATIONAL MAINTENANCE

ALIGNMENT AND ADJUSTMENT

FUNCTIONING OF EQUIPMENT

GENERAL SUPPORT MAINTENANCE

ALIGNMENT AND ADJUSTMENT

GENERAL SUPPORT TESTING PROCEDURES

ILLUSTRATIONS

REPAIR PARTS AND SPECIAL TOOLS LIST

plus numerous Figures, Tables, and Appendices

Here is the text from the cover of the 136-page manual:

"TM 11-6625-2954-24P,
TECHNICAL MANUAL,
ORGANIZATIONAL, DIRECT SUPPORT AND
GENERAL SUPPORT MAINTENANCE
REPAIR PARTS AND SPECIAL TOOLS LIST

Need to know what the complete Model Number is on the Hammarlund SP-600.
It should be SP-600-J-number or SP-600-JLX-number or SP-600-JX-number or
SP-600-JL-number or SP-600-VLF-number.
Without knowing the complete Model number the receiver is useless and
worth nothing.

Source record: 53660

The '830 has a better receiver. Both have too fast a tuning rate.The '180 still requires DRIVE tuning. The '180 has no cooling fan, tends to run hot on CW. The '180 did not come with the WARC bands installed, so ask about the one you are looking at.

My initial reaction. I'd pick the "830.

4259. Memory in

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-09 01:15:55 UTC
From: ".Alan" <wacgroupnospam@hotmail.com>
Message-ID: <9ptj4d$ku1cr$1@ID-87652.news.dfncis.de>
Source record: 53663

The schematic that came with the Alinco DJ-S11T (S41T probably the same) isn't the easist to follow, but it appears that the on/off switch on the volume control completely disconnects the battery from any IC's. So how is the memory maintained? I wrote to Alinco and was told that there is an EEPROM. I guess that is nonvolitile, maintaining the memory when the batteries (3xAA) are changed, or even when the set is just off.

Can anyone confirm this? Is it really safe to remove the batteries? This radio is a big pain to reprogram.

.Al

4260. Re: Memory in

Newsgroup: rec.radio.amateur.equipment

Message-ID: <3BC27E0F.4D0C05B@home.com>
Source record: 53666

I know nothing about these, but I do have an idea of what
it's worth and a lesser idea of what needs to be fixed.
Something about the tuning knob does not grab all of the
numbers and skips some of them because a part is broken.
Forgive me, I'm not sure exactly what the deal was with it.
If you think you might know and are still interested in
acquiring this unit, please contact me. All manuals and
documentation appear to be with the unit. The shipping costs
would be at the expense of the buyer, and I would probably
have a Mailboxes Etc., or some other professional package
it.

I've also had this rig since Dayton last year. An excellent choice. I did
have a problem with the audio, but it was sent to Yaesu, they fixed it, and
I received it back form them within a week! Don't worry about overheating
on this. The entire body is a heatsink. If you're only looking for a
2meter rig, you can't go wrong in my opinion. 73's, Nathan KA3MTT

From: GH <kb2qqm@ameritech.net>
Message-ID: <HRuw7.1052$Rw2.649473@newssrv26.news.prodigy.com>
Source record: 53670

Hi, I have an FT840 with a receiver problem. Can anyone recommend any good service technicians and/or numbers besides Yaesu. I am pretty sure the receiver is suffering from a near lightning strike and the receiver is very noisy and the meter bounces back and forth with some kind of wierd static...with the antenna connected/not connected..also
powered with a battery and powered at a friends shack many miles away. Its not the AGC and happens in any mode. the radio still transmits and receives but I have a high static popping and receiver sensitivity seems bad. Anybody ever have anything like this? Up until now the rig has been flawless. Greg kb2qqm@ameritech.net please reply direct by email.
thanks.

Source record: 53674

This probably means nothing, but I heard one on the air a few days
ago, and the audio sounded rather weak and anemic. Perhaps it was the
operator. :-) I have heard some rumors that the FT-1500's audio leaves
something to be desired. I was recently in the market for a new 2
meter radio and was trying to decide between the FT-1500 and the Icom
IC-2100H. The prices were equal and the dealer (who has never steered
me wrong in 7 years) suggested the Icom when I asked which rig had the
best audio. This is all circumstantial, but may be worth taking into
consideration. BTW, the Icom is performing well. It's a nice rig and
easy to program.

Source record: 53676
Cross-posted to:
uk.radio.amateur,rec.radio.shortwave,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.antiques.radio+phono

Notice the poor transmitter IMD numbers which is a total disgrace from amateur radio compnay. It is quite interesting to read the review of the FT1000MPmkV, and the reviewer there boasted how the ARRL paid attention to the cleanliness of transmitter IMD numbers. Yet they refused to mention that the TS2000 was crappy class C transmitter. Even most CB radios record better transmitter 3rd order IMD numbers. Besides numerous people have pointed out to them that they way they measure transmitter IMD makes the result 6db better than they really are, yet they refuse to change their methods.

If you plan to use this radio on HF with a amplifier, make sure you dont show your call at the next hamfest. But hey if you get hatred for having a dirty signal i wonder if Kenwood would give your money back for producing such a terrible transmitter..

Source record: 53681

If you don't care about 1.2 GHz, stay the hell away from the T81A. It's a nice little radio as long as you program it with a computer. The rocker switch is the worst piece of engineering that I think I have ever seen. You can punch it left, right, top, bottom, or center. Good luck on pushing it in the center.

I think the new Kenwood tribander uses the same type setup, but I'm told that it works.

Gene

Icom IC-746
This unit is just over a year old and in clean and perfect condition, no scratches dings or rubs. This unit has never failed or been serviced. It has been in a clean, non-smoking environment and ran conservatively. The original box and manual and unsigned warranty card are included. If you like mint gear you will not be disappointed. Price $1050 & shipping. (509) 710-8759. Oh, reason for selling: New IC-756ProII took its place : -)

It may be that the antenna transformer has opened up, and
static charges can no longer drain properly. Static on the
meter face may be causing your erratic readings. A drop
of dishwashing liquid and a soft damp cloth on the face
will dissipate it.

I can help:

4288. ICOM IC-746 for sale - $975

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-09 16:43:16 UTC
From: Frank Krozel <frank@electronicinstrument.com>
Message-ID: <9pv2jn$s60$1@slb4.atl.mindspring.net>
Source record: 53689

This unit is very clean, and has the voice synthesizer included, and comes
with the SM-6 desk mic!
In addition, this unit was returned to Icom where they did the modification
for the display to eliminate pre-mature burnout.
Never any problems with this clean rig, never mobile. You will be happy to
place this fine piece of equipment in the center of your operating desk.
Currently this setup lists from AES for $1,299 for the radio, plus $74.99
for the voice synthesizer, and plus $119.00 for the SM-6 desk mic!
I will ship from Illinois for $975. You save ~ $517.99!!!
Comes with original box, manual, and the optional SM-6 desk mic!!!
Reason for selling, got a Signal One.

Source record: 53693

I don't have any experience with the T81A, so I can't give you any info about that, but I do have a VX-5R and even though it's expensive for an HT, it works great. Built like a metal brick, loud audio, wideband receive, 5 watts out on the battery (BTW, the battery is *very* hard to run down - it will last a while before you need to charge it). Personally, I'd recommend the VX-5R.

Hope this helps.

Source record: 53607

I have read your replies so far and totally agree with the VX-5R selection. I have had mine for a while now and I feel it is the best selection available. My chief complaint with the radio is that I wish it had a different lighting scheme. The radio's light is a low amber with dark figures. It would be far better if this display was a light blue light with dark background but that is a very minor thing. The radio is great.

4306. FS: Yaesu FT-920 *LOADED* Contester's Dream!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-09 23:43:07 UTC
From: Marty Tippin <martyt@pobox.com>
Message-ID: <op27sts9s15fe54h89ihi5td8cqd2it3he@4ax.com>
Source record: 53608
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

FS: Yaesu FT-920 **LOADED**

This FT-920 is absolutely LOADED with filters from International Radio and is an excellent contesting rig.

Besides the standard FT-920 features (Digital signal processing, 100 watts on HF and 6m, dual antenna inputs, etc.), this radio has the following InRad filters: 400Hz CW, 2.1KHz SSB, 1.8KHz SSB and 6KHz AM. The InRad filter add-on board allows either the 2.1KHz filter to be used alone, or used in cascade with the 1.8KHz filter.

Near mint condition - only a couple of *very* minor scratches on the case. I've used this rig very successfully in contesting for the last 3 years; selling it only to finance my private pilot's license.

Just returned from Yaesu service today for an alignment and checkout, so it's in top shape for contesting season. Does not have the FM board, but who really uses FM on 10m or 6m?

Includes original box, manual, hand mic and power cable.

$1050 shipped in lower 48 states.

Please e-mail martyt@pobox.com if interested.

73 de Marty NW0L

Message-ID: <TeMw7.186422$w7.29010837@news02.optonline.net>
Source record: 53611

Hi,

I just got a chance to look at the Kenwood at a hamfest last weekend. Holding it side by side with the VX-5 I can say that they are *very* similar in look, feel and finish. If the prices at the show are any indication the Yaesu is a bit lower priced than the Kenwood. The only obvious advantage the Kenwood seems to have is that the buttons seem to be marked in a more permanent fashion.

We have several VX-5's in the family here and they all seem to work pretty well. One major advantage of the Yaesu at this point is that all the bugs are pretty much worked out. The Kenwood may or may not need some time to get it's issues sorted out.

The command stick on the Kenwood is cute, but it's still a pain to use. It's no harder to program than the Yaesu, but it's not a lot easier either. I have yet to find anybody out here on 900 or 1200 MHz to talk to portable or mobile so that's not a big deal with me.

Both radios are easier to program with a computer than from the keypad. It took a while for the software and cables to catch up with the VX-5 and I would be that the same thing would be true of the Kenwood. It also took a while for the case and accessory people to catch up with the Yasesu. Again the Kenwood may be a little behind in this department.

I'd base the decision first on price, second on being debugged, and third on accessory/software availability. I'd vote for the Yaesu.

Hope that helps.

4313. Where are all the affordable tabletop units?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-10 02:21:11 UTC
From: miaim@mindspring.com
Message-ID: <3bc3ac53.5231256@news.mindspring.com>
Source record: 53617

A few years ago I got interested in listening to various international broadcasts enough to get a couple of small portables. I always figured that someday I'd get around to getting a better tabletop unit. Now I'm ready to do so and am having trouble even finding one. It looks like all the models that I assumed I'd be able to choose from are pretty much discontinued. After checking Grove, Universal and C.Crane Co. it appears that the Drake SW-1, SW-2, Lowe HF-150 and most of the Grundig Satelite line are all history. Is the choice now really the Grundig Satelite 800 or nothing under a grand?

Basically all I want is something in the $500 (or less) range that has better sound than a Grundig YB400. The main reason that I'd like to upgrade is to get more room filling, higher quality sound than the small portables can offer, yet I seldom see any reference to traditional speaker performance capabilities on worldband receivers. A handful of user settable memory positions and good signal lock would be nice but not terribly essential. It'd also be nice if the unit got both broadcast band FM and the standard range of SW frequencies and had an output for a tape recorder, but those aren't crucial. I'm certainly not technical enough to know or care about "reverse BFO offset" or other technical features and I really won't spend a huge amount.

I'd appreciate any suggestions. Do the Yaesu FRG-100B and/or ICOM IC-R75 represent significantly better speaker quality, or is their appeal mostly technical?

Thanks,
Mike

Hi Mike,

You might consider the Palstar R30 - a very well designed receiver with wonderful customer service. WAY ahead of models like the 800.

Nice radio.

No it will not crossband repeat even with mods. The secondary band is completely muted when TXing on the primary. This also hurts for satellite use (AO-27 & UO-14)

Hi all,

I recently obtained my Technician-class license, and I'm looking to purchase an HT. My interest at this point is having a set that I can carry with me for emergencies, to work repeaters, etc. I've been looking around and I'm interested in the Yaesu VX-5R and the Icom IC-T81A. Can anyone give me some input about either of these radios? I've read the specs of course, but I'd like some "real use" information. Anything that you might be able to offer would be greatly appreciated.

Thanks!

Has anybody had any success with magnetic loop antennas? I'm considering geting one and either getting it just above the roofline on the second floor or in the attic. This is one of my only choices for an antenna as I have little space to put an antenna on my lot and some cc&r's that I may not be able to avoid although my neighbors don't seem to be respecting them).

Thanks and 73!

I would suggest you try antennas like a Screwdriver or Texas bugcatcher.
These are fare more efficient and almost unobtrusive. If you have a metal
clad building they seem to work far better than most magnetic loops. There
is a a excellent Application Note on magnetic loops on Elecrafts web page.
www.elecraft.com
You can also check www.ac6v.com
under antenna projects for more links and software for magnetic loop
design.

Both are good companies and I've owned products from both. My latest is the Yaesu VX-5R and it is a wonderful radio. I recommend it highly. Don't think it's possible to learn and memorize everything it does or can do but it is a wonderful radio for just about any use or purpose.

Solid construction, good batter life and great audio.

If you want room-filling sound, you might try connecting a small radio to a better speaker system. The powered speakers typically used with computers, for example, would do a nice job when plugged into the headphone jack of most radios. If your radio doesn't have a stereo jack, get a Y adapter from Radio Shack so you can feed both speakers.

If you also want a table-top radio for its larger, more convenient controls, I don't have any advice to offer.

Well, "technical" translates into better performance, usually :-)

As for audio, I don't know of any small tabletop radio that has good internal audio. However, in the case of the Icom and Yaesu sets, I'm guessing they have rear-panel outputs for one of their external speakers. Check the specs on the radios at the Icom and Yeasu web sites, or ask the sales person at any of the places you've called. (My JRC NRD525 has internal audio that sucks, but the external JRC 5" speaker/enclosure solves that problem.)

Looking at my catalog from AES, which lists the Icom R75, under that they show the Icom sp-7 external small speaker at $95, the sp-21 speaker at $119, and the sp-20 speaker with audio filters at $250. So I know the R75 accepts an external speaker.

You should also be able to run your receiver speaker output to the auxiliary audio input of just about any stereo receiver or computer sound card, using an appropriate patch cord from Radio Shack.

If I were buying a a sw receiver today, I'd probably get something like the Sony 2010 with an external speaker setup (assuming the Sony has a speaker output in the back). Good audio, and total cost, a lot less than $1000.

4331. Need transistor part # for MAHA C777 charger

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-10 15:34:23 UTC
From: s_graddy@yahoo.com
Message-ID: <e7d7ec82.0110100734.9eddb5d@posting.google.com>
Source record: 53635

I have a MAHA-C777 charger that I just love. I mistakenly discharged a 14.4 drill battery - Bad thing - it smoked the discharge transistor after about 2 hours of discharging. After I realized (forgot the specs on the C777) what I had done, I opened the thing up and low and behold - I can not identify the transistor information or the color bands on the two parts that are smoked.

I emailed tech@mahaenergy.com to no avail then called tech support to ask for the info. I was told "that information could not to be given out". I then asked for a price for a schematic and was told "A schematic is not available for purchase".

I don't know about you'all but that just piss'es me off (at myself for being stupid...), but still want to fix it instead of purchasing a new one. It is the electronics tech in me!!

If anyone out there has the opportunity to open your up to get the part information for me, I would appreciate it.

The part information that I am looking for is:
Q1 transistor - Part ID (include all letters and numbers)
R3 resistor - Color Bands or the resistive value

4346. Looking for the BEST handheld antenna for 2m/440

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-10 23:09:20 UTC
From: vtail@hotmail.com
Message-ID: <3bc4d44a.182449652@news.netis.com>
Source record: 53501

I'm looking for the very BEST, highest gain antenna I can find for a handheld, for the 2M and 440-MHz bands (if it has 220 MHz as well, so much the better, but that's not important).

An SMA connector would be ideal but I can live with a BNC (I have a BNC to SMA adapter).

This is to be used with the Kenwood TH-F6A, whose supplied antenna is OK but like all rubber duckies, it is limited in capability.

Thanks...

Message-ID: <20011010193556.09678.00002657@mb-fi.aol.com>
Source record: 53502

I am thinking about buying a new FT-100D now that they are on sale at AES.
However I would like to use software to control the rig but have not been able
to find any via my searches. I called AES and asked if they sold any for this
rig and was told no.
So does anyone out there know of a decent software package to contol the
FT-100D?
Any info on this will be greatly appreciated.

Thanks
Zack

Both these radios put a lot of features at your finger tips that involve some learning curve. I currently own a VX-5. I've noticed that the audio becomes very distorted when opened about 7/8ths of the way, unless your using a speaker mic. Scanning a particular memory bank is a nice feature. It allows me to put Marine in one bank, FRS in another...etc. Scanning for a TONE on your local repeater requires several key strokes, by which time the chatter has died down. I've owned mine about 1 year and take it everywhere. No regrets

4351. MAHA C777 charger

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-11 00:59:08 UTC
From: s_graddy@yahoo.com
Message-ID: <e7d7ec82.0110101659.39865c4b@posting.google.com>
Source record: 53505

I have a C777 charger that I just love. I screwed it up when I forgot the specs and discharged a 14.4 drill battery with it. It smoked the discharge transistor and the ballast resistor beyond identification.

I contacted the tech support dept. at maha energy both by email (forgot that route) and by phone. On the phone I told the tech, that I just needed the part numbers of the two devices so I could fix it. I was told "I am sorry - I can not give you that information", so I asked if I could purchase a schematic. NO was the answer, just buy a new one.

"I don't think so" not when I can fix it myself. So, if anyone out there gets an opportunity to open their C777 to look inside, please get the following:

Q1 Transistor - need all of the numbers
R3 Resistor - need either the color bands one at a time or the value

Either respond to this posting or email me - s_graddy@yahoo.com

4352. Re: FS/YAESU FT-101B $50 OBO

We'll see I guess. I'll give the benefit of the doubt for a while. I don't really need it, but I recently had a period of a few weeks where my main radio was sold, and my spare was waiting on parts, so I thought it might make a good closet special for the OCCASIONAL use!

I used a USPS money order, so the postal inspectors can tell if it was ever cashed, and they are good at following up on mail fraud. I really hope it's just a misunderstanding- I hate to see this kind of thing!

4357. Input / trade on possible HT?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-11 02:02:41 UTC
From: Evan Platt <none@seebodytoreply.com>
Message-ID: <qev9stoigoa75cavu2bbce13rprlrsgtsb@4ax.com>
Source record: 53511

Greetings.. I'm looking for advice on the choice of a HT. Let me give you some details:
This is by no means a first HT for me. I've been using 2 way radios starting with commercial use from both sides of the mike (dispatching and end user). I typically program my own gear when I had commercial equipment. Size DOESN'T matter. I'd rather have a more sturdy radio that's 2 1/2 feet tall than one that you can throw in your shirt pocket. My favorite radios were the Saber, Bendix King LPU/EPU, Icom U16, etc. Now the specs I'm looking for are:
Dual Band.
Extended recieve (at least to 155 or so, and 485 or so)
800 mhz rx (867.xxx and 856.xxx)
extended tx on VHF (at least CALCORD 156.075).

I think my only option may be the Yaesu FT-50, which doesn't meet the size criteria, but in all other respects it's a hands down winner. Can anyone confirm if it will recieve 856? Would anyone be interested in a trade for a VX5?

Any other radios out there that meet the other criteria?

Any help appreciated.

My e-mail is evan at espphotography period com.

:)

>so how well does the new Kenwood work?

So far, so good.

I've only had it for a little over a day.

It works as well as any other 5W HT on 2M, and I've also tried listening on the AM and FM broadcast bands, TV audio, aviation band, 2m, 220, and 440 bands, and it seems to work fine.

Can't hear anything on the HF bands with the rubber duckie antenna (surprise!). Soon as I find a BNC to PL259 adapter (I know I have one around here someplace) I'm going to try it on the 80-meter dipole and see how it works.

4359. Ameritron 500 watt mobile amp?

I just got the 756 the week b4 the released the II and from
what they are stating for the II to me it is and was not worth
the extra cost.

I am into RTTY and SSB and the filters are just fine. Having
some extra play with the filters and a better noise floor on
the display just does nothing great for me.

I am very happy with what the 756pro has and how it works. Would I
today buy the II? No I think not.

Good luck and remember, you have to use it not me.

I agree with the concept of saving the extra $600 dollars and use it elsewhere, maybe in a good antenna with some to spare. I too recently purchased my 756 pro only a couple months ago, knowing that the pro II was about to be release. After talking with the Icom reps at the hamfest, I decided to go for the pro instead of the pro II not only because there is not that much differences, but also for the great amount of savings by not buying the pro II when it came out. The extra savings gives you plenty of room to buy desk mic's, external speaker, power supply and still have enough left over to even get something to eat while reading over your new manuals. Go for it as you will enjoy the unit. If you later decied to go with the matching PW-1 amp, then you could even put the amount saved by buying the pro and not the pro II toward it. Like the other ham said, you will be the one using it and must make the final decision. Just remember it is the same with the 756pro and 756pro II. As soon as you buy it, they will come out with another newer model that will do just a little more than the one before; causing the fever of wanta to buya. I would have waited for the pro II, if the price would have been farily close and they would have added more features and maybe the 2/70cm bands. I told the reps at the hamfest that it would be nice if they would add the other RTTY FSK decodes to the unit for the display, CW decoding and encoding via of a computer keyboard that would connect to the unit and maybe some SSTV display. He talked like they are looking into several suggestions to add later down the road, but wouldn't say if it would be part of the 756 line or a newer model. He only said that the main differences would be a little more fine tuning of the filters and a couple extras menus and some better noise figure when using the spec scope. I would thought they would have done a lot more to have a pro II version. What they did with the pro II should have been a software update for the Pro series, unless they made some circuit changes to allow more control over the filters. Good luck with your decision; either one you buy, you will be very happy with.

The ones I've heard that had them seem to think they were ok. or at
least I haven't really heard anything bad about them. Might check
e-ham. I'm in the market for the same thing here to go with my 706. I
want to go solid state and need about 500w. I haven't decided what to
get. I might get a kit. Wouldn't mind an old metron if I ran across
one. Whatever I get needs the filter kits as I plan to use it both
mobile and in the house. So needs to be clean for house use. I think
the ameritron is fairly clean as far as I know, but haven't looked
into it. I like the henry SS amps, but are a bit pricy at 1200$. They
have good clean signals though. Whatever I get has to be clean with
low distortion specs. Of course the bias setting will have a big
effect on the linearity. Also I hear trans world <sp>?? makes a good
SS amp. Being the cheapskate I am, I may build one myself to save a
few $$$. Am looking for good designs in the 500w range. I want it
heavy duty with a good bit of overhead to where 500w will be idling
along with a clean bias setting. "Might do 800w with nasty biasing" :/
So will need to be a least a 4 transister job. As far as operation,
the main thing is to use heavy enough wiring to decrease the voltage
drop when it's under load. But that applies to any of them. I doubt
500w is enough to require any alternator changes. Myself, I'd use two
batteries if running 500w. I like a bit of overkill there. If you had
them isolated, it could keep you from getting stranded if you yakked
too long with the motor off. You'll pull some hefty current if you do
500w out. MK

4367. Re: ICOM 756PRO II vs ICOM 756PRO

If they truly improved the receiver problems then yes it would be worth spending the extra money. Despite what many hearsay opinions are about the PRo are, the receiver has severe limitations. If Icom have addressed these problems properly i would pay the extra money. Fundamental receiver performance is critical for day to day operations if you operate daily. The known IMD problems in CW of the PRO is well known, if you do operate CW why put up with a rig with a design fault. Secondly non of the receiver specs are guaranteed by Icom, hopefully this time Icom will stand by there receiver specs.

I will be buying the second PRO2 to see how it performs. This certainly is the furture of all hf radios. I am not willing to pay money out if the receiver has poor dynamic range and intercept points. Certainly any receiver that introduces artifacts to the receiver signal has a flaw. Some have a short memory of how we used to complain about birdies in our older radios. Why should be accept this crap from a manufacturer. I think we all would like to fall in love with the PRO, but some seem to get blinded by the color and glitz, i will stick to the technical fundamentals, that is the measured performance.

If the II came out to replace the original PRO at the same or near the same
price, I would go for it.
At $600 more, you would have to buy the PROII only if you have a quirky
think about buying the "latest, greatest"
As the new version will not exhibit any improvements over the old, I agree
on other suggestions to spend you money on antennas, microphones etc.
Or, save it for the PW1!

2 - Lamda Regulated Power Supplies model LCS EE 5710
with Companion sliding rack mount for power supplies and manual.

Summary of specifications

Input voltage 105-132 VAC
Output 21.5 -24.5 V ï¿½ 24.5 Adjustable
Max rated power 9.0 A @ 40 deg. C

Approximate dimensions
Height 5 in
Width 7.5 in
Length 16 in.

Total $45

Hi
I have a couple of computers towers... 200mhz, 64mb ram, vid card
8mb,56k modem and sound card ,cd rom.
166mhz, 2 cd roms, 32 mbs ram, 56k modem, sound card, vid card.
both work really good, with even throw in keyboard and mouse.
also have some satellite stuff dss.
2 receivers rca, Hughes, 1 football card never activated at dss, a
couple of lnbs, remote for Hughes, comple new installation kit maybe
even a couple of dishes. can provide photo

Looking for a hf rig to get back on hf with.
thanks chris NI4L

>price, I would go for it.

The original Pro was originally priced at around $3000. The ProII is initially priced at around $3000. The original Pro is now selling for about $2400. Wait a year or two, and the ProII will be priced at about $2400.

They're priced at about the same level, given the fact that the ProII has just been introduced, and the original Pro is at the end of its production run. The longer any piece of electronic gear goes into its marketing lifetime, the lower the price goes -- in marketing circles, they sometimes call that the "delta".

For auction on Ebay, click on:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1282751321

Heath B1 Balun (air core).

I bought this at a hamfest a few years ago, and never put it to use. Here is the technical description.

"This convenient transmitter accessory has the capability of matching unbalanced coax lines, used on most modern transmitters, to balanced lines of either 75 or 300 ohms impedance. Design of the bifilar wound Balun Coils will enable transmitters with unbalanced output to operate into balanced transmission line, such as used with dipoles, folded dipoles or any balanced antenna system. Can be used with transmitters and receivers without adjustment over the frequency range of 80 through 10 meters. Will handle power inputs up to 200 watts."

I will be glad to provide additional information, or send more detailed pictures to your email address. Contact me at w4tq@mindspring.com

In a remarkable display of stupidity, I managed to destroy transformer T701 on the PB-1439A board in my FT-301.

Of course, neither the board nor transformer are available from Yaesu. I have not been able to find the parts anywhere else.

The transformer itself is a small RF can-type coil/transformer. It is marked "Mitsumi" on the top, with 220 017 6NG8 on the side.

If anyone happens to have the board, or just the transformer, I would be happy to purchase it from you. Email with terms.

TNX es 73,

Is there $600 worth of receiver improvements, thats what i would like to know?. But the strategy of waiting may be a good one. I still think that even if the receiver is still flawed and has poor receiver numbers it will still sell. Those of you who are non believers in receiver numbers should some day try a Rohde Receiver or one of the Collins DSP receivers to see what is possible. When you have done this you will see why i am so critical. If you were ever to believe in "receiver mojo" you would believe in it if you tried one of these units. One thing i can say with agreat amount of certainty is that Icom are a long way of even coming close to the mark a Rohde or surplus Collins DSP receiver or transceiver performance.

4388. Is there such a transceiver?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-12 03:03:27 UTC
From: Rick Maddy <rick@maddyhome.com>
Message-ID: <34tx7.1028$mr3.37109@wormhole.dimensional.com>
Source record: 53541

I was curious if anyone knows of a handheld transceiver that can transmit on all the aircraft COM freqs (~118-136MHz), the business band freqs (~151MHz), and optionally 2M, 220, and 440MHz? Of course being able to receive the whole range is great too.

I've seen plenty that do all but aircraft tx and I've seen plenty that tx just aircraft but nothing that does all.

Thanks for the help.

Rick

Narrow SSB filters were not available from the factory for that vintage of radio. The factory did not consider changing the SSB filter then. You would likely need to change out the soldered in SSB filter.

Remember the Q7A is not factory specified to be software programmable. There is no factory provision for software programming of the Q7A.

What Goran is doing is back dooring his way into the Q7A. The Q7A is serviced using software and Goran is using that method to program the radio.

Both Racal (now Thales) and Harris have HT's that cover 30 to 512 MHz
continuous, AM and FM. I'm sure they are not type accepted and it may be
difficult to purchase one as an individual.

Yes i Know he runs a IC781. But they highly modified with changes to the PIN diodes etc to improve the 3rd order IP. This is not about liking or disliking Icom. All i want is a PRO with a bloody decent receiver. Signal One has shown what can be accomplished with Icom products. It only takes some minor attention to good RF engineering principles. Ask Rohde, he has bee writing about this for gee maybe 20 years. Some dont seem to learn and respect the best receiver expert in the world.

On ebay they go for arounf $300.00 They don't do much for the
receive signal but can do a lot for the transmitted signal.
A MC 90 microphone works well with a DSP-100.

W6EZ

>
> Thanks,
> Nick
>
Both are decent radios. The 180 is solid state finals, where the 830
is tube finals and driver. The 830 has the most hard core features.
VBT, notch, if shift, etc. Also the 830 can use the vfo-230 digital
vfo. I don't think the 180 can , as far as I know. I'd go for the 830.
It was kenwoods top of the line at the time it was made. "until the
930 came out". The 180 is not a bad rig from what I hear, but I'd
have to pick the 830 between the two. I've got one here with the
vfo-230 which I strongly recommend to any serious 830 or 530 user. The
internal 830 vfo has a bit of drift with temp changes. "All older
analog vfo KW vfo's do this." I imagine the 180 does this also. The
vfo-230 doesn't drift at all and has 5 memories. MK

A serious question is why does the FCC allow the hundreds of businesses to sell CB power amps (both on the internet and by mail)and as well you may find them at any truck stop with more than 2 pumps. Why are they allowed and the ham dealers restricted.

4411. Comparison of Yaseu FT-100D and Icom IC-706MKIIG

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-12 19:57:12 UTC
From: kq6td@hotmail.com
Message-ID: <43d715d7.0110121157.7f79c96a@posting.google.com>
Source record: 53564

Ready to buy and want a small unit for my nav station on my boat.
Using the radio primarily on HF, and doing Pactor II email, I know th
706 has sold a lot of units and seem very popular. But the Yaseu
comes with the Temp Controlled Chrystal Oscillator and the 500khz
filter, both of which make RTTY/Pactor easier. Both seem the right
price. I just sold my IC-735 that I bought new in 94 and sailed with
from San Fran to the Chesepeake. I lean towards the Icom and I kept
my AH-2 tuner which is supposed to work for HF on the 706. I am
running WTB ads on various classified ad boards, but mayne the Yaseu
is for me??

So, What do you suggest,

Norm (AD6SI) kq6td@hotmail.com

Seconds and thirds to what was said. You're gonna need a better antenna
as is usual since the stock antenna barely hits from where I'm at and I
think it could be a little better. I've also heard that the latex button
faces can rub off with regular usage.

Does anybody have a good reccomendation for a good case?

I have for sale an Icom IC-471H all mode 432MHz rig. This radio is in excellent condition and has had the cap replacement mod. I have the original box, original owners manual, a copy of the owners manual, sales brochure, hand mic and power cord. This is the high power version. The radio comes from a non smoking environment.
I am asking $500.00 plus shipping from 48026

4427. FAQ: Icom IC-746 HF/VHF Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-13 00:54:13 UTC

Q:3.3.1 Can I use a Heil microphone with the IC-746?
Q:3.3.2 Do I need a pre-amp to use a Heil microphone?
Q:3.3.3 How do I adjust the IC-746 for a Heil headset?

S:3.4. Keyers

Q:3.4.1 Can I hook up my straight key to the front "Elec Key" Jack?
Q:3.4.2 Can I connect my own Electronic Keyer to the IC-746?
Q:3.4.3 How do I wire up my paddles for use with the internal keyer?

S:4. IF Filters

Q:4.1 How many optional IF filters can I install into the IC-746?
Q:4.2 What optional IF filters are available for the IC-746?
Q:4.3 Which optional IF filters should I buy?
Q:4.4 What is an IF filter's "bandwidth"?
Q:4.5 What is an IF filter's "shape factor"?
Q:4.6 Why do filter "bandwidth" or "shape factor" matter?
Q:4.7 What is considered to be a narrow filter?
Q:4.8 What are narrow IF filters used for?
Q:4.9 Can an IF filter be too narrow?
Q:4.10 What's the difference between IF filters from Inrad vs. Icom?
Q:4.11 Which IF should I put an optional filter into?
Q:4.12 What's different between IF filters for 9Mhz vs 455Khz?
Q:4.13 What are the 9Mhz IF filters best for?
Q:4.14 What are the 455Khz IF filters best for?
Q:4.15 How do I get the best results from TPBT?
Q:4.16 How do I configure the IC-746 to use an optional filter?
Q:4.17 How do I configure the IC-746 to use a non-Icom filter?
Q:4.18 How do I use a CW filter in SSB mode to receive PSK31?
Q:4.19 Why is there only one optional 455Khz IF filter slot?
Q:4.20 Where do I install a 2nd Inrad 9Mhz IF filter?

S:5. Computer Control

Q:5.1 How do I wire the IC-746 up for computer control?
Q:5.2 What cables do I need?
Q:5.3 What are CT-17, OPC-478, OPC-662 all about?
Q:5.4 What is the control protocol for the IC-746?
Q:5.5 What is CI-V?
Q:5.6 What is the CI-V address of the IC-746?

Q:5.7 What computer software is available?
Q:5.8 Where can I get computer software and upgrades?

S:6. Problems and Clarifications

Q:6.1 What's that funny rattling noise I hear when I first power on the rig?
Q:6.2 Why doesn't the ALC meter work while adjusting the "mic gain"?
Q:6.3 Why can't I program any numbers into the memory names,
Q:6.4 Why isn't my output power up at 100 watts?
Q:6.5 The backlight in my LCD has stopped working. What's wrong?
Q:6.6 Is there some way to get the Icom-746 to generate DTMF tones?
Q:6.7 Why don't my "band edge beeps" match the US amateur bands?
Q:6.8 Can I transmit all the way out to the "band edge beeps"?
Q:6.9 Can I reprogram the "band edge beeps"?
Q:6.10 Do we know anything about the "band edge beeps"?
Q:6.11 How I reset back to factory default settings?
Q:6.12 What "birdies" does the IC-746 have?

S:7. Misc...

Q:7.1 Are there different versions of the IC-746?
Q:7.2 What "mods" are there for the IC-746?
Q:7.3 Where can I find plugs for the ACC connectors?
Q:7.4 Does audio to pin 4 of ACC-1 trigger the VOX?
Q:7.5 Where can I get replacement power connectors?
Q:7.6 How does one improve the fidelity of a received signal?

S:1. ADMINISTRIVIA

Q:1.1. What is an FAQ?
Q:1.2. Where can I get a copy?
Q:1.3. Where do I send feedback?

Short Answer

FAQ stands for "Frequently Asked Questions". It tries
to cover common questions/problems/issues associated
with Icom's IC-746 HF/VHF amateur radio transceiver.

The master copy is kept at:

http://groups.yahoo.com/group/IC746/files/IC746-faq.txt

Mirrored copies (after a short delay) appear at:

http://www.skysdaughter.com/icom746-faq
http://206.230.2.41/IC746-faq.txt

You do not need a Yahoo email account to access
the master copy, however, you will need a logon
account. Yes, that is a subtle distinction. Also,
not everyone is willing to have a login account at
Yahoo (even if it is free). That's one of several
reasons for maintaining the mirror sites.

Also, we post the faq monthly to:

rec.radio.amateur.equipment

usually sometime in the first ten days.

You can post questions/comments about the FAQ to
the above newsgroup.

Long Answer

The format of this FAQ should become apparent right from
the start. Questions are grouped into related sections
and subsections, roughly in the form of an outline.
Questions start in column one with their composite
section number.

When possible/practical, there will be both a short
and long answer. The short answers will try to be
brief and to the point, typically about one paragraph.
While correct, quick, and immediate, it will often gloss
over subtleties and details. The long answers will cover
theory, alternatives, dissenting opinions, and other
supplemental material. We try not to unnecessarily
duplicate information between the answers (this one
is an example of that). Long answers may go on for
several pages.

The questions that are addressed here (as well as the
answers) come from several sources.

This FAQ was created by and is hosted by folks on a
Yahoo e-mail discussion group at:

http://groups.yahoo.com/group/IC746

www.qth.net hosts a more generalized Icom e-mail list
that covers all models, not just the IC-746. You can
lookup more information or subscribe to that list at:

http://www.qth.net/info/icom.info

A bbs style on-line discussion group can be found at:

http://vartel.com/icom746/icom746index.html

There are also the following newsgroups:

rec.radio.amateur.equipment
rec.radio.swap

Specific comments or clarifications can be sent directly
to the FAQ coordinator. "Content submissions" would be
greatly appreciated. However, general discussion/debate
over the answers is best done in a more public forum,
like one of those mentioned above.

S:2. GENERAL INFO

Q:2.1. Should I buy an IC-746?
Q:2.2. What are the IC-746's features?
Q:2.3. How does the IC-746 stand up to the ______ ?

Short Answer

Yes. Try it, you'll like it.

Long Answer

This FAQ is maintained by happy, loyal, and devoted
IC-746 owners. What do you really think we're going
to say?

One thing nearly everyone (both loyalists and detractors)
agrees upon is that you should make every effort to
try out a rig before purchasing it.

For features, check out the IC-746 specifications
from brochures available at your local amateur radio
equipment store, on-line documents at various vendor
sites, or directly from Icom's WWW site at:

http://www.icomamerica.com/

Most of the 746's problems or faults show up either in
this FAQ (eventually) or in the archives at:

http://groups.yahoo.com/group/IC746

Probably the most objective, quantitative comparisons you
will find are the QST product reviews (freely available
to ARRL members):

http://www.arrl.org/members-only/prodrev/

Simpler, more limited, comparison charts are available
on the Amateur Electronic Supply WWW site at:

http://www.aesham.com/compare/comp_hf.html

User written reviews can be both more personal and
more detailed. They can also be more biased. You can
find plenty of them at:

http://www.eham.net/reviews

This topic has come up several times on Yahoo's IC746
discussion group. One of the more interesting threads
along these lines starts with message 1012 and ends
with message 1028. I'm told that message 1023 is
particularly good. Another good thread starts with 1049
and ends with 1077.

http://groups.yahoo.com/group/IC746/message/1012
http://groups.yahoo.com/group/IC746/message/1023

Q:2.4. How much is a used IC-746 worth?

Unlike used cars, there is no official "blue book"
for ham equipment. Only YOU can decide this.

Your best bet is to peruse the archives for

rec.radio.swap

over the past 6 months or so.

You might also check out one of the following sites

Electronic Boneyard Prices:
http://www.geocities.com/CapeCanaveral/Hall/8701/ham/boneyard.htm

E-Bay prices:
http://aade.com/hampedia/prices.htm

Virtual Hamfest - Recent Prices:
http://www.vhamfest.com/prices.html

Good luck.

Q:2.5. Is there a dedicated HF net for the IC-746?

Not yet. It's been proposed several times, but nothing
has ever congealed.

There two HF nets devoted to Icom rigs in general.
They meet Sundays, on or about 14.317 Mhz, at 1700Z
and 2200Z.

Q:2.6. Is there an electronic copy of the IC-746 operators manual?
Q:2.7. Is there an electronic copy of the IC-746 service manual?

No such copies currently exist, although they would quickly become popular if they did. As of May 2001, Icom had no plans for creating either. Additionally, Icom considers any such external productions to be a violation of their copyright. Ray (the product manager at the 2001 Hamvention) was very firm on this.

Hard copies of both are available through any Icom retailer as well as through the W7FG Vintage Manual WWW site at:

http://www.w7fg.com/

Q:2.8. What is the IC-7400?
Q:2.9. Is there an IC-746-Pro or IC-746-Mk-II?

Too make a long story short, as of September 2001, the IC-7400 appears to be a successor to the IC-746; sold only in Japan. Based upon Japanese-English translations of and photos from Icom's WWW site, the IC-7400 appears to be an IC-746 with several bells and whistles. Some of the rumored enhancements include:

* 51 selectable digital filter widths (tied to TPBT?)
* Sharp or Soft filtering
* Manual notch filter (replaces APF?)
* Rudimentary in-rig RTTY decoding.
* Microphone equalization (digital instead of analog)
* Digital speech compressor (instead of analog)
* Digital voice recorder

Depending upon your point of view, the IC-7400 is either an IC-746 incorporating the new 32-bit DSP from the IC-756-PRO-II, or its an IC-756-PRO-II stripped down into an IC-746 chasis. Either way, its an intriguing rig.

More information can be found at:

Icom's WWW site in Japan:

http://www.icom.co.jp/ham/products/ic-7400/

A broken-english translation is available at:

http://www.qsl.net/ab4oj/icom/ic7400/index.html

A photo of a real unit is at:

http://www.onjapan.net/2001/hamfair/aut_0006.jpg

Yahoo discussion group devoted to the IC-7400:

http://groups.yahoo.com/group/IC7400

And a nice ham-written synopsis at:

http://www.qsl.net/ab4oj/ja7ude/ic7400.html

S:3. Accessories

S:3.1. Power Supplies

Q:3.1.1 What power supply should I use with the IC-746?

Short Answer

Any good quality, communications grade, power supply
rated at least 20 amps or more (continuous duty) should
do just fine. However, most of us use larger supplies
(for a variety of reasons).

Popular supplies that are known to work (via testimonial):

Astron RS-35M 25/35A linear
Astron SS-30 25/30A switching
Astron SS-25 20/25A switching
MFJ 4125 22/25A switching (MightyLite)
MFJ 4225 22/25A switching
Samlex SEC-1223 23/25A switching
Kenwood PS-52 20/22A linear

Popular supplies to avoid (via testimonial):

Astron RS-20 - overloads too easily
Diamnond GZV-4000 - RF hash on 40/20m

Long Answer

This question typically arises for one of two reasons.
Either someone wants to buy a new power supply, or they
have an existing power supply that they want to use.
In both cases, the issues are: load capacity, size,
weight, electrical noise, mechanical noise, cost,
features, and appearance. Buying a new supply gives
you a lot of options; there are plenty of great supplies
out there. With an existing supply, you have no control
over these factors; you're simply looking for a "fit".

You'll want to consider the following factors.

Reviews

QST tested and reviewed many supplies in January and September, 2000. You'll find the results informative. ARRL members can access those and other reviews on-line at:

http://www.arrl.org/members-only/prodrev/pdf/pr0001.pdf

http://www.arrl.org/members-only/prodrev/pdf/pr0009.pdf

Transportability

The larger the capacity, the larger and heavier the supply. If size and weight are critical for you, consider a "switching" supply as they are usually less than half the size of a "linear" supply.

Electrical Noise

All supplies generate some electrical noise. Typically the noise from linear supplies will be in the form of AC hum while from switching supplies the noise will be RF hash. Communications grade power supplies of either type are designed to minimize the noise, and generally cause no problem. (i.e. this is not a good place to cut corners)

"Computer" power supplies that are pressed into radio service are particularly bad when it comes to electrical noise.

Usually, the harder you push a supply (the heavier the load), the worse the noise will become.

Mechanical Noise

Many supplies have cooling fans. Sometimes, the fans are loud enough to be a noise problem themselves. Fan noise is variable from supply to supply (even within the same manufacturer and model). Likewise, hearing tolerance varies from operator to operator. Thus, it's hard to tell in advance if a specific supply will have a problem. Time may yet tell.

We do know that fans are driven by load. The closer you operate to a supply's capacity, the more the fan runs.

Also, some of the transformers used in linear supplies will generate an audible hum. The transformer itself vibrates with the AC supply. Mass seems to help here. Usually (not always) the heavier the transformer, the less the hum.

Its pretty easy to put a noisy power supply under a table, behind a cabinet, or elsewhere to cut down on the noise level. Just be careful to allow proper air

flow for cooling.

Features

Most of us consider current limiting, over voltage protection, and high temperature shutdown to be mandatory in a new supply.

Fuses or breakers are required for UL certification. Buy spare fuses right away; they never blow at a convenient time.

Meters are non-essential, they are luxury items. They make the supply bigger and more expensive. However, they can be very handy and even fun. Lets face it, most hams enjoy gadgets.

Adjustable output voltage is a useful feature, more useful than you might realize. Most new supplies have it (usually internally).

Load Capacity

The size, weight, and cost of a power supply all tend to increase with its load capacity. Those factors encourage us to get the smallest supply we can. There are also factors that encourage larger supplies; such as noise, heat, accessories, etc...

The IC-746 specifications list a current drain at maximum transmit power of 20A at 13.8Vdc. Thus, the recommendation that your supply should handle 20 amps (or more) continuously.

It is possible to run the IC-746 with a smaller supply, but extreme caution and discipline are required. Very few, if any, of us recommend it for normal operation.

For example, the 20 amp maximum in the IC-746 specifications is full key-down at full power. You could just lower your RF power to help match your load to the supply. You could even run the IC-746 QRP, drawing as little as 3-4 amps on transmit.

Another factor is operating mode. Some of us have measured full-key loads as high as 21-22 amps. Normal SSB transmit at full power draws 6-15 amps. But FM, digital, and CW will generally pull 18-20 amps at full power.

Continuous vs. Intermittent Load

There are issues concerning a supply's "intermittent", "peak", or "surge" capacity. A supply might be rated

for 16 amps continuous and 20 amps peak. Normally, the IC-746 runs at about 2-3 amps for receive and only hits the 20 amp maximum during transmission. Thinking of transmitting as "peak" or "intermittent" activity can lead one to think that such a supply is acceptable. It might even be. However, a problem develops when we try to define what peak or intermittent activity is.

Everyone would agree that transmitting for 3 minutes at 20 amps till the repeater time-out cuts you off is not a peak. How short a time constitutes a peak and at what duty cycle? Without some sort of specification or standard, "peak" and "intermittent" could mean just about anything. Most of us feel more comfortable with a "better safe than sorry" approach.

This dual rating system for power supplies is a great source of confusion. Specifically, you could buy a power supply rated for 20A and have it fail under full load. The Astron RS-20 and Pyramid PS-21 are examples of such supplies. While both are excellent supplies, they just can't keep up with an IC-746 under full power.

The exact definition of intermittent, peak, or surge as used by the power supply manufacturers has not been established.

(Some of us are going to try to talk to the supply manufacturers about this to get more details)

To quote a tech from Samlex:

Maximum rating is surge current requirement for starting reactive loads or short term dynamic loading and is limited to a few seconds.

This supply is not designed for pulsing loads.

Currents beyond the maximum rating will force the unit into current limit and the output voltage will drop and it will no longer be regulated.

Meanwhile, MFJ said (of the MFJ-4322):

Our units will shut down at surge. At 25 amps surge, the power supply will shut down at about ten seconds.

So while it is theoretically possible, most people do not use supplies rated less than 20 amps continuous. In fact, most use substantially bigger supplies.

Bigger Supplies

Why use a bigger supply? There are several reasons.

As noted earlier, the closer you operate a supply to
its rated capacity, the greater the electrical noise,
mechanical noise, heat, etc...

Strain leads to wear-and-tear. So it can be argued
that a bigger supply should last longer.

The IC-746 is rated at 20 amps max, but loads as high as
21-22 amps have been measured. "Your mileage may vary"
definitely applies.

The continuous rating is generally based upon an
ambient air temperature of 20 C. The rating degrades
as the temperature rises, by how much, we're not sure.
Filed Day conditions will be stressful to your supply.

13.8 V times 20 A yields 276 watts. There's a tendency
for some supplies to drop voltage a little when they
get hot or overloaded. There's also a tendency for
some radios to increase their current pull when the
voltage drops. At 12 Vdc, that same 276 watts would
imply 23 amps. You push the supply capacity, which
drops voltage a little, which drives the rig current
up, which pushes the supply further ... then BANG.
You blow a fuse. (AK6R has actually seen this effect
with his 756pro)

There are plenty of other devices that need DC power.
You need to account for them as well.

Other and future rigs may have greater power demands
(like the 756pro). Extra capacity now may avoid the
need to upgrade your supply in the future.

You might well spend most of your time in a low power
situation (SSB QRP) and get by with less than 5A.
But, in an emergency, you and your gear may be called
upon to operate in different modes, at higher power,
and with heavier duty cycles. Planning ahead for the
worst case usage helps prevent an untimely failure at
just the wrong time.

Conclusion

So, you'll find most of us with power supplies ranging
from 20 to 30 amps continuous; and some with even
bigger supplies.

S:3.2. Antennas

Q:3.2.1 What antenna should I use with the IC-746?

Short Answer

Any antenna you want.

Long Answer

Seriously. ANY antenna will work with the IC-746,
with the proper interfacing. People have even made
contacts using dummy loads.

Antennas are probably the most uniquely individualistic
aspect of any ham station. Antenna selection is a BIG
topic; much too big to deal with in an FAQ (at least
for this one).

The IC-746 has 50 ohm, unbalanced, coaxial RF outputs.
With the automatic ATU capable of handling SWR
mismatches of up to 3:1, you have a wide variety of
choices available to you.

There are many excellent books on the topic; the ARRL
has a couple dozen of them. A good one to start with is:

The ARRL Antenna Book

At over 800 pages (and over 1,000 antennas), you're
sure to find SOMETHING that fits your style and budget.

For more information, try hanging out on one of over
50 e-mail groups on the topic at

http://groups.yahoo.com

or visit one of the hundreds of antenna oriented WWW
sites indexed by AC6V:

http://www.ac6v.com/
http://www.ac6v.com/antprojects.htm

or follow along with the discussions on the newsgroup:

rec.radio.amateur.antenna

or visit the on-line antenna magazine:

http://www.antennex.com/

or, you could just put up a trusty old dipole.

Just be sure you do use an antenna. The IC-746 does not
like to transmit into an open load (no connected antenna).
It will put an undue (and possibly fatal) strain on your
output transistors.

Q:3.2.2 What range can the automatic antenna tuning unit (ATU) handle?

Officially, the automatic ATU in the IC-746 can handle SWR mismatches of up to 3:1. In practice, many people get even wider ranges.

Some have pointed out that, even though the internal tuner may tune a particular antenna configuration, if there is a high SWR, you could end up burning out the tuner.

We have at least one case (reported by KG6GLN) where the detector diodes in an IC-746 were fried. According to the ICOM tech, "... it could happen if you tried to use an external antenna tuner in conjunction with the internal tuner. "

Q:3.2.3 Are there any "tips" to using the ATU?

Yes. The ATU appears to pay attention to the reflected power, not the SWR. [Note: we'd love someone to analyze the schematics to confirm or deny this.] This is evidenced by two effects.

When starting from a close match at QRP power levels, the auto ATU doesn't always home in on the best match. Increasing the power level and tuning again often improves the match, which the ATU then retains when returning to QRP power.

The converse situation can also cause trouble. When starting from a poor match at full power, the auto ATU sometimes can't find a match at all. In this case, tuning at lower power allows the ATU to get a match, which the ATU then retains when returning to high power.

If one end of a band consistently gives you trouble while the other end tunes easily, then you may still be able to coax the ATU into matching the antenna. Start in the portion of the band where the ATU works and tune there. Then, move your way across the band in increments (maybe 25Khz at a time), tuning as you go until you reach the desired portion.

Q:3.2.4 How do I use a "beverage" antenna?
Q:3.2.5 How do I use different antennas for receive vs transmit?

As previously stated, nearly ANY antenna can be used with the IC-746, provided it can be matched to the 746's 50 ohm, unbalanced antenna terminals. However, there is more to using a "beverage" antenna than just impedance matching.

Beverage antennas tend to sacrifice gain in order to improve their signal to noise ratio. So, while they are good for receiving, they are poor for transmitting. Therefore, you would typically use a separate antenna for transmitting.

While not convenient, the IC-746 can be configured to use one of its antenna ports for transmitting and the other for receiving. Run the rig in split mode with both VFOs on the same frequency, but have VFO A use antenna 1 and VFO B use antenna 2.

A more traditional approach (albeit, more work) is to take the HF transmit signal from one of the accessory ports activate a coaxial relay (via a driver transistor) to switch between antennas. This is the same basic setup you would use to control an external amplifier.

Q:3.2.6 Can I use the internal ATU along with an external ATU?

Maybe. Theory says yes, but Icom says no. The results are mixed. Use at your own risk.

Many people use an external ATU along with their IC-746. Usually, they leave the external ATU switched to "bypass" and let the internal ATU do its thing. For troublesome bands/antennas, they turn off the internal ATU and engage the external one.

Others use an external ATU to match their antenna to the middle of the desired band and let the internal ATU handle the rest. In theory, the ATU doesn't actually care what's hooked up to it; it simply tries to match up to the impedance it sees.

In most cases, the above approaches seem to work fine. Many hams have been applying both for years with no problems.

However, some IC-746's have had their ATUs go out from fried detector diodes and driver transistors. On many repairs, Icom has blamed the failure upon external tuners. One ham was told that external tuners can cause problems even when they are switched to "bypass".

Nobody has been able to adequately explain why an external tuner would cause such damage, particularly when bypassed. Some speculate that tuning with low power is safer than tuning with high power (if nothing else, its at least more polite).

We need more information on this, but at least you've been warned.

S:3.3. Microphones

Q:3.3.1 Can I use a Heil microphone with the IC-746?
Q:3.3.2 Do I need a pre-amp to use a Heil microphone?
Q:3.3.3 How do I adjust the IC-746 for a Heil headset?

In theory, the IC-746 has enough microphone gain to use
an unaided Heil microphone. Heil even has a newsletter
that discusses the topic, see:

http://www.heilsound.com/newslettermay00.htm

In short, you use moderate compression along with
moderate mic gain for the best results.

However, the above procedure just doesn't seem to work
for everyone. For those that still have gain problems,
adding the Heil HMP microphone pre-amp should work
just fine.

S:3.4. Keyers

Q:3.4.1 Can I hook up my straight key to the front "Elec Key" Jack?
Q:3.4.2 Can I connect my own Electronic Keyer to the IC-746?
Q:3.4.3 How do I wire up my paddles for use with the internal keyer?

Short Answer

Yes, virtually any type of key/keyer can be connected
to the IC-746 via either the front "Elec Key" jack
or the back key jack. However, the two jacks require
different wiring, and only the front jack will give
access to the internal electronic keyer.

The front "Elec Key" jack on the radio accepts a
3-conductor 1/4 inch stereo phone plug and can be wired
for use with anything. The back "key" jack accepts a
2-conductor 1/4 inch mono phone plug and can be wired
for use with either a straight key or an external keyer,
but not for the internal keyer.

See page 68 in the operator's manual for wiring details
and pages 23 and 27 for the programming details.

Long Answer

FOR A STAIGHT KEY OR EXTERNAL KEYER:

For a diagram on how to wire the stereo plug see page 68
of the operating manual. For a straight Key or keyer,
wire only the tip and the Sleeve, and leave the ring
as No-Connect.

tip ring sleeve
oooo ====]]]]]]} ---------> 2 cond wire to key/keyer
(+) (nc) (-)

The back "key" jack is a mono 1/4 inch phone plug and
is easy to wire.

When using the front Jack, You also have to set the
radio to recognize that the ring is not used. To set
the radio, You do have to go to the "key", "set"
menu and tell it you will be using a straight key.
See Page 23 and page 27 in the operation manual.
While in CW mode press KEY(F4), then press SET(F5),
Press the down arrow(F2) until you reach the sixth menu
(KEYER TYPE), Use the Main tuning knob to set the type
of keyer to "Straight Key".

TO USE THE BUILT IN ELECTRONIC KEYER WITH PADDLES:

Wire the 3cond Stereo plug (use the front jack) so
that the "Dit" is the tip, the "Dash" is the ring and
the sleeve is common(-). (You can also wire up a "bug"
this way (without electronic keyer))

oooo ====]]]]]]} ---------> 3 cond wire to paddles
(dit) (dash) (-)

To set the radio to use the internal electronic keyer,
You do have to go to the "key", "set" menu and tell
it you will be using paddles. See Page 23 and page
27 in the operation manual. While in CW mode press
KEY(F4), then press SET(F5), Press the down arrow(F2)
until you reach the sixth menu (KEYER TYPE), Use the
Main tuning knob to set the type of keyer to "Elec Key".
(or "bug Key" to use the bug without electronic keyer)

S:4. IF Filters

Q:4.1 How many optional IF filters can I install into the IC-746?

There are two (2) slots for optional filters in the 9Mhz IF,
and one (1) slot for an optional filter in the 455Khz IF.

Q:4.2 What optional IF filters are available for the IC-746?

Available filters for the 9Mhz IF include:

Icom FL-101 250 hz (CW narrow)
Icom FL-232 350 hz (RTTY, CW narrow)
Icom FL-100 500 hz (CW/RTTY narrow)
Icom FL-223 1.900 Khz (SSB narrow)
Icom FL-103 2.800 Khz (SSB wide)
Inrad 121 250 hz (CW)
Inrad 111 400 hz (CW)
Inrad 320 1.800 Khz (SSB)
Inrad 110 2.100 Khz (SSB)
Inrad 123 2.800 Khz (SSB wide)

Available filters for the 455Khz IF include:

Icom FL-53A 250 hz (CW narrow)
Icom FL-52A 500 hz (CW/RTTY narrow)
Icom FL-222 1.800 Khz (SSB narrow)
Icom FL-96 2.800 Khz (SSB wide)
Icom FL-257 3.300 Khz (SSB wide)
Inrad 306 125 hz (CW) (might not fit)
Inrad 122 250 hz (CW)
Inrad 116 400 hz (CW)
Inrad 322 1.800 Khz (SSB)
Inrad 314 2.100 Khz (SSB)
Inrad 109 2.400 Khz (SSB)
Inrad 124 2.800 Khz (SSB wide)

(The Inrad 306 is listed on their WWW site,
and is electrically compatible, but might
not fit in the available socket.)

While not an optional filter, W2ENY has a kit to modify
the IC-746 by replacing either the stock 9Khz or 15Khz
wide internal filters with a 6Khz wide filter. See the
"mod" question of the FAQ for more details.

Q:4.3 Which optional IF filters should I buy?

Better to ask, "Why would I even need filters?".

Quite possibly, you'll won't need any optional
filters. Use the Twin PassBand Tuning (TPBT) to
dynamically adjust your IF bandwidth first. Properly
used, TPBT can give you nearly any bandwidth you want.
You may decide that you don't need any anything else.

There are over a thousand (1,429) possible combinations
of optional filters. Most of them will make sense
(i.e. be useful) to someone, somewhere. As it is a
matter of style and situation, ultimately, the choice
will be up to you.

We've broken up this issue into several questions, each targeting a more specific issue or problem. Short of writing a book, it is the only hope of providing any useful answers.

Q:4.4 What is an IF filter's "bandwidth"?
Q:4.5 What is an IF filter's "shape factor"?

Also called "passband", a filter's bandwidth is a measure of how wide a signal will pass thru the filter. For IF filters, this is typically measured as the span between the filter's -6db points. (Some folks measure bandwidth at the -3db points. Pay careful attention to the specifications when comparing filters)

"Shape factor" tries to represent steepness of the filter's attenuation curve. Typically defined as the ratio of the -60db passband to the -6db passband (bandwidth). The perfect shape factor of 1.0 is unobtainable. Shape factors of 2.0 or less are considered excellent.

This is one of those situations where a picture is worth a thousand words. A good look at the spectral response curve of a typical filter will make these terms clearer.

Inrad publishes basic performance curves of most of their filters on-line. An example of a typical curve is:

http://www.qth.com/INRAD/graphs/116.gif

Several companies have good on-line treatments describing basic filter characteristics, complete with diagrams.

Corning Frequency Control has a very concise page styled in a glossary format at:

http://www.ofc.com/filters/definitions.html

Vectron International also has a nice on-line treatment of filter characteristics at:

http://www.vectron.com/products/xtal/filter.htm#definition

The folks at Piezo Technology Inc. describe filter characteristics with attenuation curves.

http://www.piezotech.com/filter/gen_desc.html#att

Q:4.6 Why do filter "bandwidth" or "shape factor" matter?

Narrower bandwidths reject more noise and improve sensitivity. Wider bandwidths provide better fidelity.

Narrower bandwidths also reduce the number of simultaneous signals the rig can "hear". This reduces the AGC pumping action caused by nearby signals, particularly important for CW and digital modes.

Smaller (tighter) shape factors reject more noise and improve selectivity. Larger (wider) shape factors generate fewer problems/complaints with fidelity or ringing.

Q:4.7 What is considered to be a narrow filter?

In the context of (and for the purposes of) this FAQ, a narrow filter is any filter that has a smaller bandwidth than the stock 2.4Khz wide filters. However, most texts will describe a filter as being narrow if its bandwidth is smaller than that of the desired signal.

Q:4.8 What are narrow IF filters used for?

Usually, narrow filters are used to reject unwanted signals or noise. The narrower the bandwidth, the less noise there will be and the better the sensitivity. You can lose part of the desired signal in the process, but that may be preferable to the interference you're trying to reject.

Q:4.9 Can an IF filter be too narrow?

Yes, an IF filter can be too narrow, but sometimes, that can actually work to your advantage. We'll describe only a few specific situations as examples.

When the IF filter's bandwidth is less than the bandwidth of the desired signal, then part of the signal will be rejected. This degrades the fidelity (quality) of the received signal. In phone modes, the fidelity loss is often mistakenly perceived or described by operators as "distortion".

Fortunately, the inherent information redundancy of human speech allows it to be readable even when an overly narrow filter has rejected part of the desired signal. That's where our advantage comes from.

One form of interference is when a nearby signal overlaps your desired signal; as in an overcrowded band. Rejecting the interfering signal necessarily rejects part of the desired signal as well. Thus, the filter

is too narrow to allow all of the desired signal
to come through, but it is narrow enough to reject
the interference. While the result is "distorted" in
comparison to a clean signal, it is still more readable
than if you left the interference there.

Another example would involve CW or PSK31. The more
narrow the filter is, the less the interference and
noise. In these modes, it's almost impossible for a
filter to be narrow enough to actually reject part of
the desired signal, as in the previous phone example.
Instead, when a CW/PSK31 filter gets too narrow,
you start to experience the auditory equivalent of
tunnel vision. This can make it difficult to scan
around for signals.

One of the handy things about TPBT is that you can
narrow your effective IF filtering bandwidth at any time.

Q:4.10 What's the difference between IF filters from Inrad vs. Icom?

Inrad filters tend to have a superior shape factor to
Icom's (smaller numbers are better) as well as deeper
stopbands. They also tend to be cheaper.

When dealing with adjacent channel interference, the
filter shape (depth and slope of the attenuation curve)
is generally the prime factor. Inrad filters tend to
outperform the Icom filters for this application.

For example. The stock Icom filter in the 455Khz IF
has a -6db bandwidth of 2.4Khz and a -60db bandwidth of
about 5Khz. That gives it a shape factor of about 2.1
The comparable filter from Inrad has a shape factor of
1.6, a -6db bandwidth of 2.4Khz and a -60db bandwidth
of 3.8Khz.

This all means that the Inrad filter has a steeper
attenuation curve, resulting in better extraneous signal
rejection and improved selectivity.

The Inrad filters tend to have greater ultimate
attenuation than the Icom counterparts. Thus, Inrad
filters tend to do a better job of adjacent signal
rejection than Icom's filters.

However, while the 455Khz Inrad filters are drop-in
replacements for the Icom counterparts, the 9Mhz filters
are not. They need a short piece of coax and a connector
to wired up to the filter first. The adapting connector
plugs into the filter slot, thus alleviating any mods

to the radio itself. Reported assembly times range
from 1-4 hours per filter, depending upon the skill
and care of the installer.

Q:4.11 Which IF should I put an optional filter into?

Realistically, the performance differences between
using filters in the 9Mhz IF vs the 455Khz IF are fairly
small and will probably go unnoticed in normal operation.

Most people make this decision based upon slot
availability and filter cost.

Q:4.12 What's different between IF filters for 9Mhz vs 455Khz?

The 455Khz IF filters tend to have superior performance
characteristics while the 9Mhz IF filters tend to be
less expensive.

Q:4.13 What are the 9Mhz IF filters best for?

When dealing with interference from nearby signals,
the sooner you reject the unwanted signals from your
RF chain, the better. So a single narrow IF filter
in a 9Mhz slot may outperform a single filter in a
455Khz slot.

Q:4.14 What are the 455Khz IF filters best for?

On the other hand, filters in the 455Khz IF seem to do
a better job of eliminating background noise, possibly
due to their superior performance characteristics.

Q:4.15 How do I get the best results from TPBT?

TPBT works best when the 9Mhz and 455Khz IF filters have
closely matching bandwidths. Non-matching bandwidths
will still work, but are less intuitive, which can
cause confusion.

There are several techniques to using TPBT. The one
described below has the virtue of simplicity.

Starting with both filters in their center, detented,
position (widest effective bandwidth), tune in your
desired signal as accurately as possible.

Grasping both IF shift knobs simultaneously, adjust for
the best sound. If you have a nearby, interfering
signal, then you'll probably have the best results
shifting your bandpass away from it.

Now, adjust just the 455Khz IF shift (the inner knob)
in the opposite direction for the best sound.

Q:4.16 How do I configure the IC-746 to use an optional filter?

After you've installed a filter, you need to tell
the radio about it. Using the SET menu, tell the radio
which filter you've installed (by Icom part number)
and which slot it is in. Then, hold in the FILTER
button for two seconds to bring up the filter selector.
Cycle through your available filters by mode and by
wide/narrow until everything is set up the way you want.

See the operator's manual for details.

Q:4.17 How do I configure the IC-746 to use a non-Icom filter?

You have to lie to the rig.

All of the IC-746 filter settings are on the basis of
Icom part numbers. (This is supposed to make things
easier for new operators.) Just tell the rig you've
installed the Icom crystal that most closely matches
the one you're actually using.

Lying to the rig does have a side effect.

The 746 cannot actually shift the IF filters' passbands.
Instead, the 746 shifts the LO frequencies of the 2nd
and 3rd IF stages to shift the signal back or forth,
aligning the edge of the desired signal with the computed
edge of the filter's passband.

Small lies generate small effects, like when you
tell the rig that a 2.1Khz wide filter is actually
1.9Khz wide, yielding a 100hz offset in the control.
Larger lies generate larger effects, like when you tell
the rig that a 400hz filter is actually 2.4 Khz wide,
yielding a 1,000hz offset in the PBT control.

Q:4.18 How do I use a CW filter in SSB mode to receive PSK31?

Icom took their ease of use one step further, and
programmed the rig to prevent the use of a CW filter
while in SSB mode. They didn't know about PSK31 at

that time. So again, you lie to the rig during setup, telling it that the crystal is wider so that the rig will allow you to select it for SSB use.

Q:4.19 Why is there only one optional 455Khz IF filter slot?

Nobody knows for sure, but the most popular speculation is that it made the radio cheaper.

Q:4.20 Where do I install a 2nd Inrad 9Mhz IF filter?

According to K7ZL, the place Inrad tells you to put the filter is way over on one side in a little opening next to a fan, and that works fine. But he has found a second location. When you have the rig opened, if you go on a line from the 9 Mhz filters, then to the 455 Khz filters, and keep on going towards the front panel, you will see a square metal plate on the circuit board. He mounted his second filter on top of the metal plate, on its side, and it seems to work fine.

S:5. Computer Control

Q:5.1 How do I wire the IC-746 up for computer control?
Q:5.2 What cables do I need?
Q:5.3 What are CT-17, OPC-478, OPC-662 all about?

The IC-746 is computer controllable through a serial interface, but it is not RS-232. This is both good and bad. Bad, because you can't just plug it straight into your computer (wrong voltages, etc...). Good, because you can control four separate rigs with the same serial line. Therefore, to connect the IC-746 to a computer requires some interfacing. Icom made three: the CT-17, OPC-478, and OPC-662.

The CT-17 is the full boat. Versatile, it will allow 4 rigs to be controlled by a single RS-232 serial line. It's also the most expensive option and requires external power.

If all you want to do is connect up a single rig, then Icom's WWW site lists the OPC-662 remote PC control cable as the official part. If you can find it, then great. Most people can't. Instead, many hams have successfully used the OPC-478 PC cloning cable.

It's less than half the cost of the CT-17. However, it is very short (1 ft ?) and will require a 1/8 inch stereo to mono plug adapter for use with the IC-746.

When you buy the RS-746 remote control software from ICOM, it comes with a single rig cable (OPC-662 or OPC-478?).

W2ENY sells a complete CT-17 clone and a single rig cable. They're both more complete package than Icom's, coming with cables and software resources on a CD-ROM. They're also cheaper. You can find out more at:

http://www.geocities.com/w2eny/civ/

http://www.geocities.com/w2eny/icom_cable/

You could purchase the nearly universal rig interface, the RigBlaster, from the folks at West Mountain Radio. It does a lot more than simply computer control, and is adaptable to other manufacturers (for a price).

http://www.westmountainradio.com/

There's really not that much circuitry in "simple" interface cables, and many have homebrewed them for as little as $10. Supposedly, the November 2000 issue of QST has a suitable design (with feedback in the January 2001 issue). On-line circuit diagrams based on the QST article appear at:

http://www.ambersoft.com/Amateur_Radio/Icom_Interface.jpg

and

http://www.qsl.net/civ_commander/interface.jpg

KD6UU posted detailed schematics and instructions on eham.net:

http://www.eham.net/articles/1588

and then wrote an excellent updated follow-up article at:

http://www.qsl.net/kd6uu/icomci.html

The actual design of the interface circuit is subject to debate (as the above link will make clear). Several alternative designs (along with a wealth of related information) are available from DF4OR's WWW site at:

http://www.plicht.de/ekki/civ/

You can also purchase clones of this interface hardware from a variety of sources:

Universal RS232 Serial Interface for Icom/Yaesu

http://www.butel.nl/icomr2/icom11.html

K1NU ICOM Computer Control Interface

http://home.att.net/~k1nu/k1nu/Products/

RTS-01 Computer Interface cable for Icom HF Radios

http://rtsars.com/othercables_template.cfm

Q:5.4 What is the control protocol for the IC-746?
Q:5.5 What is CI-V?

CI-V is the control protocol used by ICOM for remote PC control of their equipment. The basics of the protocol are documented in the manual. However, most people will prefer the documentation available from DF4OR's WWW site at:

http://www.plicht.de/ekki/civ/

or the documentation that comes shipped with W2ENY's control cables:

http://www.geocities.com/w2eny/civ/

http://www.geocities.com/w2eny/icom_cable/

W7FG Vintage Manuals has listings in their catalog for both the CT-17 Level Converter and for the CI-V Communications Interface on their WWW site at:

http://www.w7fg.com/

Q:5.6 What is the CI-V address of the IC-746?

The CI-V address of the 746 is $56 (hexadecimal).

Q:5.7 What computer software is available?
Q:5.8 Where can I get computer software and upgrades?

There are several choices (compromises?) available. On one end of the spectrum, we have programs that replicate nearly all of the IC-746 controls on the computer. On the other end, there are programs that do computer assisted contact and contest logging.

There is a fairly comprehensive listing of CI-V compatible software on DF4OR's WWW site at:

http://www.plicht.de/ekki/civ/

We'll mention some of the available software options
below. User reviews for some of the below software
can be found at:

http://www.eham.net/reviews/

and

http://www.qrz.com/search.pl?topic=reviews

** Icom RS-746 software

Icom SELLS a program called RS-746; buying it
is certainly the path of least resistance. It is
available through the usual retail channels. It comes
complete with both software and the necessary cabling
(OPC-662?). Many people describe it as a thing
of beauty. (Of course, beauty only runs skin deep.)

A description of the software can be found at:

http://www.icomamerica.com/amateur/hf/746soft.html

To quote ICOM's own support FAQ (circa May 2001):

Q: Where can I download the ICOM PC programming (or
cloning) software?

A: The ICOM programming software is not freeware,
and is not available for download on our Web site,
or anywhere else on the Internet. It must be
purchased either from an authorized Icom America
dealer, or direct from ICOM. RT Systems also
develops programming software for ICOM radios.

Ray (the product manager at the 2001 Hamvention) was
very firm on this issue. They take a dim view of the
pirated copies available on the internet.

Last word we know of (January 2001), Icom had no plans
to update/fix/enhance the RS-746 software.

** RT Systems software

OK, so Icom refers us to RT Systems at:

http://www.rtsars.com/

However, as of May 2001, RT Systems does not have a 746
control program. They told N8AVX (in February 2001)
that they had no plans to do so either.

** Kingsmith Software

Kingsmith Software is developing control software for the IC-746 (RATS IC-746), but as of May 2001, it wasn't available yet. More information is available at their WWW site at:

http://www.kingsmith-software.com/

** W2ENY

W2ENY ships a CD-ROM with lots of software and documentation along with the PC to rig interface cables he sells. Many of the packages listed here are also on his disk.

http://www.geocities.com/w2eny/civ/

http://www.geocities.com/w2eny/icom_cable/

** RadioComm

Arachnophilia has several programs: RadioComm, IcomControl, and EasyTuner (among others). Check out the download section on their WWW site is at:

http://www.arachnoid.com/

** YP Log

Tony Field (VE6YP) makes a radio control and logging program called YPLOG. His WWW site is at:

http://www.nucleus.com/~field/

** TRX Manager

Some say that TRX Manager by F6DEX has more features than the original radios. More info can be found at:

http://www.trx-manager.com/

http://www.hosenose.com/trx-manager/

** XMLOG

The freeware logging software produced by W1ECT also talks directly to the IC-746. You can learn more at either the WWW site:

http://www.xmlog.com

or at the yahoo e-mail group site at:

http://groups.yahoo.com/group/xmlog

** TR Log

One of TR-Log's claims to fame is that it will run on just about any PC. More details at:

http://www.qth.com/tr/

** CI-V Commander

A package that integrates well with the DxLab software
suite. More details at:

http://www.qsl.net/civ_commander/

** IRC

One of IRC's claim to fame is selectable skins.
You get to choose what you want your radio to look
like, be it IC-746, IC-706, or even a 007 spy watch.
More details at:

http://n9zle.tripod.com/

** YPlog

YPlog can control 4 rigs at a time and supports logging
and contesting.

http://www.nucleus.com/~field/

** ScanCat

Very extensive scanning support, including automatic
digital recording to your hard disk,

http://www.scancat.com/

S:6. Problems and Clarifications

Q:6.1 What's that funny rattling noise I hear when I first power on the rig?

Often, its the antenna tuning unit. The relays make
audible clicking/rattling sounds.

Q:6.2 Why doesn't the ALC meter work while adjusting the "mic gain"?

Despite what the manual says, the ALC meter only works
for SSB; not FM, CW, or RTTY. Nobody knows what (if
anything) the ALC reading means on the other modes.

Q:6.3 Why can't I program any numbers into the memory names,
the CW memory keyer, etc...?

Use the keypad to enter numbers. The dial only does
letters and punctuation.

Q:6.4 Why isn't my output power up at 100 watts?

One possibility is your DC supply voltage. The IC-746 really wants a full 13.8 Vdc. Check the actual voltage your rig is receiving. You may need to adjust the voltage setting on your power supply.

If your rig isn't getting the voltage you think it should, then check for voltage drops along the power cord and across joints and connectors. It's possible to lose as much as a half volt per connection. Solder joints and use high quality connectors where possible.

12 AWG wiring is the minimum, but 10 AWG is better.

Q:6.5 The backlight in my LCD has stopped working. What's wrong?

Short Answer

Its probably one of the display driver transistors on the S-Logic board behind the display. It will have to be replaced.

Long Answer

Unfortunately, this has become a problem for some 746's. It's not the actual 'lamp' itself, but one of the driver transistors. The lamp is fluorescent, and will probably never wear out. Even if it did, the lamp isn't available as a separate part; it's part of an assembly you need to get from Icom.

There is a DC/AC converter driving the "lamp". Check the S-Logic board for transistors Q301, Q302, Q303, and Q304. Q302 is the most likely culprit as it is the voltage regulator for the dimmer function. If you have a DC voltage on the collector which is variable by the dimmer function on the radio, then this transistor is probably OK. Q303 and Q304 are the next most likely candidates. These 2 transistors are in push-pull configuration to drive the X-former (base is 180deg phase shift by the X-former)

Refer to pages 6-1, 9-1, 10-1, and 11-2 in the "Service Manual" for more details.

Several folks at:

http://groups.yahoo.com/group/IC746

have successfully performed these repairs themselves.

OZ5ACI feels that the way the Q302 transistor is mounted
is a design flaw. Icom used the cooling fin of the
transistor as a soldering point, thus if it gets too
hot, the solder might melt. That slowly deteriorates
the soldering material resulting in a lost connection
and a cooked transistor. He has a feeling that future
cooked transistors can be prevented by simply unsoldering
the transistor cooling fin to lift it and lengthen the
center leg to establish connection at the cooling fins
soldering point.

AH6LE counters that if the transistor gets hot enough to
melt solder (300 degrees or so), then there are other
more serious problems. Most solid state devices won't
survive such temperatures, thus we're seeing the result,
not the cause.

OZ5ACI used an "overkill" transistor from his junk box
and had to cut a bit of the cooling fin to make it fit
under the shield. The original transistor (2SB1201)
is not very tall and can be left at an angle so no
cutting is needed (or wanted!). He says it's all fairly
simple. The only trouble is that the front section of
the 746 has to be taken totally apart and getting it
back together with no dust behind the plastic screen is
a pain. Get yourself a small can of workshop compressed
air or CO2 if you can.

Of course if your 746 is still under warranty, you
may want to consider going that route. Either way,
contact Icom for the parts you need.

Q:6.6 Is there some way to get the Icom-746 to generate DTMF tones?

No. The IC-746 will not generate DTMF tones.

However, you have some options for generating DTMF
tones yourself.

The good news is that Icom's compatibility table
shows that the HM-14 DTMF hand microphone will work
with the IC-746. It even comes with a handy switch to
enable/disable the UP/DN buttons. Remember, you have
to press the PTT switch to use the DTMF pad.

The bad news is that the HM-14 is a discontinued item,
so availability is limited. Also, as K9HFX discovered,
there are apparently two versions of the HM-14.
The version without the scan button enable/disable
switch did not work for him. More information is needed.

While not listed on Icom's compatibility charts as such, VE4HAY reports that the DTMF pad on the HM-56 will also work with the IC-746, but it's scan buttons will not.

Another option is a portable tone dialer, such as one that you could get at any Radio Shack. Just send the tone sequence right through the microphone. Not all such devices give access to the 'A' - 'D' tones, but those tones don't get used much anyway.

Some have suggested wiring a DTMF pad into a microphone cable, much like what you would do for a TNC. However, as yet, nobody has shared any success stories.

Q:6.7 Why don't my "band edge beeps" match the US amateur bands?

Nobody knows what (if anything) the band edge beeps correspond to.

Q:6.8 Can I transmit all the way out to the "band edge beeps"?

Yes, you can transmit all the way out to the beeps. The IC-746, as shipped from the factory, can transmit outside of the amateur radio bands. This has been tested and confirmed on several rigs via dummy loads.

Q:6.9 Can I reprogram the "band edge beeps"?

No, there is no known way to reprogram the band edge beeps. There are no fixes or planned updates from Icom dealing with them.

Q:6.10 Do we know anything about the "band edge beeps"?

The band edge beeps generate a lot of discussion and speculation. As of June, 2001, the band edge beeps on all tested rigs correspond to:

1.8 - 2.0 MHz
3.4 - 4.1 MHz
6.9 - 7.5 MHz
9.9 - 10.5 MHz
13.9 - 14.5 MHz
17.9 - 18.5 MHz
20.9 - 21.5 MHz
24.4 - 25.1 MHz
28.0 - 30.0 MHz

If you know of an UNMODIFIED rig which differs from this,
then please let us know.

While nobody has figured out what the band edge beeps
correspond to, we have been able to rule out several
possibilities.

They do not correspond to the amateur radio frequencies
in Japan. For that matter, they do not correspond to
the ham allocations in any of the IARU regions.

They are not a combination of all available amateur
radio from around the world (i.e. a minimal superset).
They are much wider than that.

As wide as the band edge beeps are, they do not encompass
all of the MARS/CAP frequencies. To do that still
requires a "mod".

Any other ideas or info?

Q:6.11 How I reset back to factory default settings?

While pushing in [F-INP] and [M-CL], push [POWER]
to turn power ON.

Q:6.12 What "birdies" does the IC-746 have?

"Birdies" are spurious signals internal/inherent to the
rig itself. They are normally generated by harmonics
and/or mixing products of the internal oscilators (IF,
VFO, display driver, CPU clock, etc...) that are picked
up by one of the RF/IF stages of the rig.

Birdies are usually perceived as silent carriers on
AM and FM and as steady tones on SSB and CW; sort of
like someone tuning up on that frequency. Thus the
perceived frequency of occurrance is affected by your
preferred sidetone.

Often, local noise sources can be mistaken for birdies.

True birdies tend to be consistent from rig to rig.

The following frequencies have been submitted as possible
birdies. There have not been enough correlated reports
yet to confirm these as birdies. More information and
reports are needed.

1.957
3.608

144.400

S:7. Misc...

Q:7.1 Are there different versions of the IC-746?

Yes, there are at least two distinct versions of
the IC-746.

While most of the indications are circumstantial,
one definitive piece of evidence are the two different
procedures for modifying the transmit/receive range.

Another definitive indication are the 2m differences
between the U.S., Japanese, and European versions.
In Japan, the IC-746 has different auto-repeater offsets
and is limited to only 50w RF output. In Europe,
the IC-746 does not transmit above 146Mhz and has no
auto-repeater offsets at all.

There are varying reports about the necessity of a
microphone pre-amp when using Heil microphones, leading
some to speculate upon differences in the microphone
input circuitry. K9HFX was unable to generate DTMF
with an HM-14 microphone; that might be related.
There isn't enough information yet to be conclusive.

Some rigs seem to have problems with the transistors
that drive the LCD backlight, some do not. This might be
due to a circuitry change, or a difference in assembly.
The jury is still out.

The only way the issue will be resolved conclusively
is for someone to organize a data collection effort
to sort out these details by serial number. So far,
no one has volunteered.

Q:7.2 What "mods" are there for the IC-746?

Short Answer

Most people who ask this question are looking for ways to make the IC-746 transmit or receive additional non-amateur RF bands. Modifying the IC-746 to transmit outside of the amateur bands is generally considered to be illegal. There are a few exceptions; like perhaps MARS/CAP, transverter usage, changes/additions to ham bands, etc..., but they can become controversial.

That said, MARS/CAP/TX/RX modifications for the IC-746 (and many other radios) can be found at:

http://www.mods.dk/

Long Answer

Not all mods are about TX/RX frequencies. Here are some of the others.

W2ENY has devised a way to replace the stock 15KHz or 9MHz IF filters for AM work with 6KHz filters.

http://www.geocities.com/w2eny/icom/filter.htm

AH6LE has modified his IC-746 to provide safe sequencing for EME work.

http://www.ah6le.net/radiomods.html

OK2WY has a "Simple CAT / programming interface for ICOM RIGs". Rumor has it that he has also designed an in-board step attenuator.

http://www.qsl.net/ok2wy/projects.htm

Some folks have replaced the transistors that drive the LCD backlight in an attempt to prevent overloading and burnout. See the question devoted to LCD lamps.

Q:7.3 Where can I find plugs for the ACC connectors?

They are 7-pin DIN connectors (the old style AT keyboards used 5-pin Din). A couple (of many) possible sources are:

Digi-Key http://www.digikey.com/

BUX CommCo http://www.buxcommco.com/

Your local electronics store either have them or can get suitable substitutes. For example, most Radio Shacks have the 8-pin DINs in stock (#274-026). They are compatible after you remove the center pin.

Q:7.4 Does audio to pin 4 of ACC-1 trigger the VOX?

Pin 4 of ACC-1 does not trigger the VOX circuitry, nor is the level of that input affected by the front panel mic gain control.

Q:7.5 Where can I get replacement power connectors?

Short Answer

The connector you need is often called an "OEM-T" connector. You can order Icom part number OPC-025A or OPC-025D from any of the major ham equipment retailers for a pre-wired cable.

Long Answer

Icom's cable compatibility chart lists the OPC-025A. Most retailers sell the OPC-025D. Both apparently work. The OPC-025A is rated for 20 amps, while the OPC-025D is rated for 30 amps. Most hams prefer the beefier cables.

Rather than finding another Icom connector, many folks put inexpensive connectors on the cables of all their rigs and power sources. That way they can use any rig with any supply no matter what brand. Particularly handy for switching between mobile rigs. Even Radio Shack has these, cheap.

One very popular connector is the Anderson PowerPole.

http://www.andersonpower.com/

which is readily available from either

http://www.dcpwr.com

http://www.powerwerx.com/

In fact, the PowerWerx folks have pre-wired, PowerPole to OEM-T cables ranging from 1 to 10 feet long that are much cheaper than the Icom part (less than half the cost). You can always just snip off the PowerPole connector if you don't want it.

Many clubs and organizations have been standardizing on the PowerPole connectors for their high amperage 12VDC power. This makes all of their equipment inter-compatible and interchangeable; a real plus in an emergency. There's a good article on that subject at:

http://www.dcpwr.com/standard.html

Q:7.6 How does one improve the fidelity of a received signal?

Here are several possibilities (not in any particular order).

* Assure precise tuning

* Use a high quality external speaker or headphones

* Try to run without pre-amps or with attenuator

* Reduce the RF gain (increase AF gain to compensate)

* Set TPBT to widest bandwidth

* Use wider IF filters

* Turn off NR, ANF, and NB (in that order)

Contributors + Acknowledgements

There are two kinds of contributors to this FAQ: direct
and indirect.

Direct contributors have written entire passages that
have been incorporated nearly verbatim. Often, they are
specifically authoring something with the FAQ in mind.
Also, they are individuals who have been recruited to
review specific sections prior to distribution.

Indirect contributors have had their comments and input
collected and assimilated from public correspondence
on discussion and news groups, often without their
knowledge. They were simply answering questions,
offering advice, or otherwise just helping people out.

The coordinator has not tried to keep a record of who has
contributed what; the book-keeping would be horrendous.
All sources of information have been INVALUABLE and
are APPRECIATED. Listing contributors here is a
small token of thanks for their neighborly spirit and
generosity. The Coordinator apologies if anyone has
been missed.

True, but a Signal One runs about 10 or 12 grand, last time I looked. Maybe what they, at Signal One, do could be accomplished more inexpensively... maybe...

I still have my Icom 735, which seems to do a fine job, even though its filtering is less sophisticated than that of other Icoms of that era. Maybe the 735 was just a happy accident in Icom history...

I doubt you're going to find such an animal because the fcc's requirements for transmitting on each band differ greatly, and you don't want some squirrel transmitting where he shouldn't be transmitting (not calling you a squirrel, but such a device would be attractive to folks who thumb their noses at the fcc and transmit where they should not).

Message-ID: <Q1Ox7.6358$e5.58026@newsfeeds.bigpond.com>
Source record: 53587

If we read Rohdes advice, we find that simple things like biasing the PIN diodes properly or using high quality PIN diodes results in a huge increase in the IP3 number. This has been proven my Rohde himself and by the likes of Signal One. If all it takes is changing a few diodes in the case if the IC765 and IC781 to get world class performance one has to wonder why the manufacturers dont do this. If we talking about IP2 and IP3 numbers, the mere changing of the pin diodes results in IP3 numbers of +30 dbm beating even the FT1000MP MK5. I doubt that the PRO2 will even come close to this number. Considering that the IC781 is almost 10 years old how far have we come? In the case of the PRO it was such huge step backwards its not funny. So much for progress! It does not take 12 grand to build a decent radio Elecraft has proven that, it just requires paying attention to the minor details rather than the bells and whistles. I had a IC735 and i still have my IC781 and IC765 these are the best Icoms produced by Icom everything after that was just a token gesture. Yes it has all Dr Rohdes mods in them and they beat all new comers including the mighty MK5. By the way i have heard some rumours about the IC785, apparently Icom will not be holding back in terms of performance. It will have features like plug in circuit boards, a full LCD laptop size screen, benchmark receiver numbers and all based on the same architecture as PRO2. I hope they listen to their customers and make sure the receiver is good, there is no transmitter power spikes, the transmitter has low phase noise and good IMD numbers, and that they offer a receiver tracking preselector. Geez all they have to do is look at Rohdes EK2000 and copy that architecture. Lets hope Icom is listening and they dont produce a dudd like the IC775DSP or something flawed as the original PRO. But some seem to learn slowly thats the Japanese way, they dont like being told they wrong or made a mistake. must be the butt kissing chain of command.

Pay close attention to the crappy transmitter IMD numbers, its worst than class C. A disgrace that a company can produce such a HF transmitter and get away with it. I wonder why the ARRL did not stick to their standards and make comment. Maybe they are happy that people splatter the bands with such crap.

4435. Re: Which rig ... TS180S, or TS830S?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-13 03:11:03 UTC
From: willy <willyacht@yahoo.com>
Message-ID: <cdOx7.6368$e5.57669@newsfeeds.bigpond.com>
Source record: 53589

I have owned both these radios. The TS180 was a reliable radio, the only problem i had with mine was the finals going which was easy to repair. It was a radio that was well ahead of its time It has a quite receiver, and is easy to use. The speech processor is of the audio type but adds a slight punch.

The ts830s being tubes is one of the cleanest radios IMD wise. It has low phase noise and when you use good filters is a superb performer. The problem with the TS830S is that it has numerous bugs, related to grounding and connections. These are well documented. It is so old now if anything breaks you will have troubles getting spares. I find tuning the radio for minor changes in the band a pain in the ass. I also tried the 200 watt mod and could get 190 watts out with a clean signal. It ran cool at 150 watts for SSB use. The speech processor is the RF type and is fantastic. The audio quality from this rig is superb. The stock SSB filters have poor shape factor and really needs a narrow filter for serious work. Make sure you have the model with the 12 murata filter in the front end, some early models had the 5 pole filter. This make a huge difference in the selectivity. Hey if you can pick up both these radios for a good price grab them. You wont be disapointed. Ah on the TS180 you dont need the external VFO to work split, it is capable of doing that as standard. The external Tuner is useless. By the way the TS830s drifts if you can the VFO230 with is PLL get that, its mandatory these day with stations now tuning .0000. In summary i would lean to the ts180s for convenience, if you dont mind fooling around the 830s would make a good choice. Either way you wont be disapointed.

I am just saying I really wasnt impressed by the rig at all it was OK. But I owned the 746 and the 847 before getting the kenwood. Out of all the 746 is best then 2000 then 847 running a farrrr last. For the money the 2000 sucks it should be priced in the 746 class.

This is certainly not the first time that the ARRL review has failed to
make comment on unacceptable performance levels. BUT they do get some
credit for publishing the lab numbers so the rest of us can see the
results of the lab testing.

Yesa International Radio has produced filters for Icom radio for some years now. many times you will need to wire in their filters as the case size is much larger than the filter position in the radio. I have chatted with users of International Radio filters over the years and many were quite satisfied with their purchase.

What radio amateur? Not a contester thats for sure. Its a OK rig..but its
price is a joke. It should be in the 746 class.

New Items FS or Trade

GE Mastr II Repeater UHF 75 watt. In deskmate case with Power supply and GE / Decibel Duplexer. Repeater has encode and decode boards. Internal metering in card rack and an Intercom board. 1 set of 2C Icoms included. $800.00

S-Com 100 controller with all manuals. Has an upgrade prom and new manual for the new capabilities. $150.00

Motorola 1404 A UHF Pass / Reject Duplexer. 250 watt rated. $150.00

Sinclair UHF 50 watt Duplexer. On ham band from factory. $100.00

Phelps Dodge UHF 6 cavity Mobile duplexer. $100.00

Regency UHF Amplifier. Has 19" rack and is mounted on the heat sink which covers the back of the rack. I think this is 50 watts but looks like a 100 watt I have seen. With Regency rack mount power supply. $200.00

GE KPC-300 VHF portable radio 16 channel scan. Has like new battery and charger. $175.00

GE MPD 48 channel UHF battery and antenna. $100.00

Midland 70-336B VHF 8 channel Mobile 35 watts and scan. $85.00

GE PCS VHF 136.-150. 2 channel with battery, charger , and antenna. Radio on 2 ham Frequencies now. $85.00

GE Mastr II control heads $5.00 each
GE Mastr II control cables. 8 channel. 1-10 $12.00 Lower price for bigger quantity.
GE Mastr II Microphones. $4.00 each
GE Mastr II Mic hang up boxes. $4.00 each
GE Mastr II Control head brackets. $5.00 each
GE EC channel elements $5.00 each
GE white Versatone filters. $4.00 each E-mail for Frequency.
GE Mastr II Tone boards for Versatones. $5.00 each
GE Mastr II TOT and squelch boards. $3.00 each
GE Mastr Executive II VHF Mobile extender. $10.00 each
Panasonic Hand held Computer and Power supply for use in the GE programmer. $60.00

Terms
Buyer pays for shipping and Insurance. If you do not want insurance I will not be responsible after I ship the package.
I take checks and US Postal service Money orders. Checks and other Money Orders cause a hold on shipping until they clear.

I take trades but only for things I want. Every thing is AS IS.
I am tired of replacing radio's that I know work when they leave here and
come back junk or parts switched out.
Want list
Ham Dual-band Mobiles. I have enough Portables.
GE Radios, Let me know what you have. Mobiles, Heads or portables.
Programming proms for the GE suitcase programmer.
Most urgent need is for MPS portable Proms.
I have other Radio's and parts FS or trade but too many to list.
Email for wants and I will look.

I know what you are talking about; why do manufacturers sell equipment in the first place, when they don't want to supply support documentation! I just returned an expensive FM tuner to the dealer, when I discovered that the manufacturer would not provide service documentation. For that reason, I refuse to purchase any Uniden products anymore. If we all boycotted those manufacturers who followed those practices maybe they would change their tune.

Source record: 53478

I cannot fairly compare the two since the only small rigs I have owned are
the
Kenwood TS50s and IC706s. I have had good service with the 706 and would
not hesitate to buy another if the need arose. I have the original 706 and
a MKIIG. The only reason I went with these two radios is that the Yaesu
will
NOT meet NTIA standards, and I use my HF on CAP, SHARES, and FEMA. Hence the
706s and TS50s which will meet the military requirement with the addition of
the TCXO option.

Nope. I don't think you will find such a thing--at least, legally. And if there were some other issue that came up with your operations WRT FCC, they would take a dim view of it. About the only folks that can do such are the military. I bet the manufacturers like this arrangement as well--more radios they
can sell.

Well, first, do you want a mobile or a handheld? You might find a mobile under $100, but it is liable to be limited in capabilities. Whichever you choose, you need to get these capabilities: CTCSS (PL) encode - this is required for accessing many repeaters, DTMF - needed to access autopatch, Memories - the more the better. Any other options would depend on what you want, mobile or handheld.

A good handheld to look for will be the Radio Shack HTX-202. This was discontinued several years ago, but is widely available at the price range you mentioned. Very good radio and has a solid list of most-used features, including CTCSS encode/decode, DTMF, call & priority channels as well as standard memories, 5 watt output w/ standard battery pack. This last is important, many of the newer, smaller HTs only have milliwatt output (200-300 mw) with the battery pack, which will limit your range severely.

As for a mobile, if that's what you want, start checking the hamfests. I saw many 2m mobiles under $100 at the recent hamfests. Be sure and take somebody with you that is familiar with the recent crop of mobile rigs, there are a lot of sow's ears out there, with some silk purses mixed in. some of the hamfests I've been to recently have had a test table set up so you can check out your purchase. If the hamfest you go to has one of these, be sure and get an agreement from the seller that the radio is returnable if it doesn't check out, and be wary of a seller who won't. I've had sellers accompany me to the test table to ensure that the rig was hooked up properly, which was fine with me.

Good Luck & 73,
Mark

For Sale: HF rig. TS-440S, built in antenna tuner. I'm the original
owner, non-smoking. Rig was never mobile. 9+ appearance, operates
100%.
Includes installed 500 cycle CW filter . Filter is fantastic when
operating PSK-31 or other digital modes.
$400.00 plus shipping from Florida 34446
Still have the original shipping box.
Contact: Joe, K4LL@ARRL.NET, (352)382-0809

Write me a note and I will e-mail a picture of it to you

P.S. I'm selling the above because I just received my brand-new rig with
all the bells and
whistles. I don't have room for the TS-440S in my shack, besides.....
I'm spending my retirement money on myself..... rather than letting it go
to my kids. They'd just party with the money !

Is it uneven and kinda ragged when tuning across the band? It should
normally look pretty smooth and even as you spin the dial in a
constant motion. If it is, you may need to align the encoder. They
tell you in the manual to use a motor to drive the vfo. I don't bother
with this. With VERY fine tweaking with the trimmers, you can usually
get it to track right without having to go through that. What I do if
the encoder is jumpy is to adjust VR1 or VR2 just a tiny bit in one
direction, and see if any better. If not, go the other way a tiny bit.
You have to juggle back and forth as they interact, but usually you
can get it to track ok with a little experimenting. I had to do this
with my vfo-230 when I bought it, and it's been fine since. I'm not
aware of any other problems, so I'd check all the mods, KW info etc if
thats not the problem. MK

4484. HOUSTON AREA HAMFEST OCTOBER 20th

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-14 14:04:09 UTC
From: ka5glx <biekert1@swbell.net>
Message-ID: <tXgy7.1286$Bo.348974095@newssvr12.news.prodigy.com>
Source record: 53488

Hi fellow Amateur Radio Ops
The Clear Lake ARC will hold HamFest 2001 on October 20th.
We have great door prizes (ICOM 706 MKII G, T81 quad band HT, and an Alinco power supply)
Entry is $3/person (kids 12 or younger free if accompanied with an adult)
Buy lots of tickets ($1=1 ticket, $5=6 tickets, $10=12 tickets, $20=25 tickets)
We have lots of vendors and ham sellers. In fact all tables are currently sold out.

www.clarc.org/hamfest.htm has maps, directions, prizes, and more

This Hamfest is all inside the Bay Area Community Center (NO OUTSIDE TAILGATING ALLOWED!)

See you THIS SATURDAY OCTOBER 20th, 2001

73 de KA5GLX

CLARC HamFest 2001 October 20th
www.clarc.org/hamfest.htm

4485. Re: Ameritron 500 watt mobile amp?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-14 14:08:31 UTC
From: "Rudy Marcelletti, K8SWD" <rudym@net-link.net>
Message-ID: <3bc9999c$0$35612$bbae4d71@news.net-link.net>
Source record: 53487

The AL-500 does not have auto filter selection or band changing--so you must mount it where you can get to the switches and knobs (unlike some of the others, such as SGC, which are hook up and forget about them).

Even with a couple of extra batteries you will not be yakking very long with out the engine running, unless your extra batteries are huge 250 AH or more batteries.

Put an AL-500 next to a Henry or SGC and you will see very noticable differences especially in design and quality. The Ameritron looks like it was built in someone's basement from a kit that was short some parts.

4487. Yaesu FT-2600 - improved?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-14 15:33:23 UTC
From: zaax@aol.com
Message-ID: <20011014113323.17530.00001444@mb-mq.aol.com>
Source record: 53490

I would like to get a 2mt mobile for my car. Currently the Yeasu FT-2600 is on sale at AES for $170.00. A while back I owned a FT-2400 and loved it. Very rugged and intermod free.
In researching the FT-2600 it looks like it has had a problem loosing memories (http://www.eham.net/reviews/detail/341). Does anyone know if Yaesu has corrected this problem?

Thanks
Zack

I don't think the FCC can be everywhere. I think it's up to us to help.
If you see a violation, collect the necessary information (date,time,
address, description,ect) and when you get home go to the FCC
Enforcement web site at http://www.fcc.gov/eb/ and tell them about
it. It may take a while, but they do seem to follow-up eventually.
Maybe it's just a case of no-one doing anything about the problem.

>(200-300 mw) with the battery pack, which will limit your range severely.
<snip>

There is a small error in your specs on the HTX 202. The standard
NiCAD battery pack will provide 7.2 vdc. for 2.5 watts out. The radio
will produce 5 watts only when connected to a 12 vdc. source. I have
had one of these gems for a number of years and they are a good
performer. You can find lots of them out there for a very reasonable
price.

Don't do it unless you want to see high power transmit go out in 12 to 18 months of use. I have already lost a FT-8100R and a friend (KB9WMU) has lost high power Tx on his FT-1500. Another friend's sister has lost high power as well on her1500. That's 3 Yaesu radios within 20 miles of each other, at least that's all that I know of ....YET.

Yaesu has a problem with these radios and won't own up to it. I just bought a brand new Kenwood TM-G707A and 'love' it. And if it goes sour my next radio will be an Icom.

Don't let Yaesu make you pay to be their QUALITY CONTROL INSPECTOR!!!

BTW I traded the FT-8100 for a Mirage 5016 amp, at least it will Tx above 20 watts :^]

My girlfriend (KD5OUY) has my old FT2700RH, and it occasionally
decides to do nothing on high power. It won't act up while there's a
power meter anywhere in the car, though, so I can't prove it, but
several times I've been able to barely hit a repeater at 5W, go to
35W, and nothing. People a few hundred yards away can't hear it on
simplex. The radio is still showing full power when this happens, so
the foldback circuit isn't doing it, and the SWR on that antenna is
1.5:1 or better across the band.

I guess Yaesu would try to blame it on my power supply or
something...we all know how unreliable 10ga wiring directly to an 850A
battery can be.

That's it!!! The radio 'looks' like it transmits but don't. People were telling me I was breaking up, at first I thought they were pulling my leg, BUT I caught it doing it with a meter I put inline and left there. So I opened it up and adjusted the high power limit down to 35 watts and it would work every time back at 50 watts you had a 50/50 chance of being heard.

And Yaesu did the same trick with me said it was a power supply problem, then it was an antenna problem, then it was in need of a cap across the power feeds (none of which was the REAL problem) then they finally said it had to be sent in for repair. That didn't happen (fool me once shame on you, fool me twice shame on me) so the FT-8100 got traded off to someone who knew it's history, I wasn't going to stick someone with it like Yaesu did me. BTW the new Kenwood TM-G707A I'm running now is hooked up to the same antenna, power supply, and feed lines as the Yaesu, but it works perfect!!!

Unfortuantely, the FT-2700 only has 5W and 35W settings, so I either
get QRP or nothing when it decides to act up. I'll probably yank the
case off at some point and try dropping it to about 25W to see if that
does it.

Out of curiosity, did you happen to try some extra cooling on the heat
sink? Mine seemed to be almost fine in my car, with a modification to
the A/C ducts blowing on the back of it, but the problem has gotten
worse in her car, where there's not as much extra airflow back there.

>BTW the new Kenwood TM-G707A I'm
>running now is hooked up to the same antenna, power supply, and feed lines as the
>Yaesu, but it works perfect!!!

Same here...my G707 works great, with only a fuse change. (The 10A I
had for the Yaesu just isn't *quite* enough for high power on the
Kenwood..had me worried for a minute before I realized it drew 11A.)
The Yaesu is now on as-near-identical-as-possible setup in OUY's Kia;
same antenna and NMO mount in the middle of the roof, same 10ga wiring
direct to the battery, exen the coax and power lead runs are in the
same areas of her car as in my Dodge.

Yeah, you're right, Larry. I've got one of the monster battery packs from W&W Assoc., and my Bird shows near enough to 5 watts as makes no difference. I keep the stock battery as a backup but hardly ever use it. I keep the 202 and a 404 in my "Go Bag" that I keep by the front door in case the end product ever hits the rotary air mover, and ARES is activated.

4514. $10 portable sound solution

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-15 07:28:10 UTC
From: miaim@mindspring.com
Message-ID: <3bca8bbd.1068222@news.mindspring.com>
Source record: 53417

I'd mentioned being dissatisfied with the sound coming out of a Grundig Yachtboy 400PE in an earlier thread. The suggestion was made to try simply hooking the little radio up to small computer speakers. Since I wasn't sure how much speaker this little radio could handle, and since Radio Shack was temporarily out of powered computer speakers, I tried a pair of their mini-stereo speakers. These are the smallest and cheapest speakers they had. I've never been much impressed with anything Radio Shack sells, but these little 2.25" crappy speakers are already a big improvement over the standard Grundig monaural offering. They're RS pt # 40-1400, are encased in yellow plastic and cost a whopping $9.99 and are made to plug into the standard 1/8" earphone jack of any portable radio, cassette or CD player. I'll probably fool around with some bigger and better speakers, but even these dinky little buggers are enough of an improvement in sound that a friend in another room asked what I'd done to improve the sound. Check 'em out. With these and a simple wire antenna, even a little portable can be listenable.

They aren't allowed. They just haven't been caught yet. I hear quite a
few stories about the fcc going after truckers. I've heard of them
running stops at weigh stations etc and checking and yanking any
illegal gear. If you reported a truck stop selling illegal amps, I'm
sure eventually the fcc would check them out. How soon probably
depends on how far the truck stop is from a field office. MK

Hello all. I have a TS50(not TS50S) of second hand. It has full TX from 0-30 MHz, and I would like to become TX to their original values. I have surfed over the net and found some modifications, but they are all for open to full TX...How could I close the full TX and restrict it only to permitted frequencies?.
I have found on the PC board of my TS50 diodes D1,D2,D3,D4,D5. Diodes d1,d3,d4,d5 are cut on 1 of the 2 extreme(but the diode is there), but on d2 there are nothing.
What should I do? Should I solder diodes d1,d3,d4,d5 again? (and leave diodes D2 empty (as now)...I think yes but...
And also I think I should reset the CPU...

Any idea....

Best regards from Tito

I have for sale a nice Icom IC-730 HF Transceiver. This one has low hours.
It does have a few small scratches on one side, but overall it looks great.
It works very well. The transceiver is a 100 watt unit covering 80 through
10 meters including the WARC Bands. It is a SSB, AM, and CW rig and is small
and great for mobile operation. Comes with original Mic and Power Cable.
Price is $325 shipped in lower 48. Thanks, Charlie Hugg,
K5MBX

:
: John KB0UY
:
Go to an RV shop and buy new adapter bolts that extend
beyond the existing terminals to provide stud/nut termination.
My major frustration is that RV or Marine/Starting batteries
aren't available with side posts so if you want better deep-
cycle performance, you need to get top-post adapters and
watch out for dimensions or you will need to go dual-battery.

You may find an empty fuse slot. In some cars there is a
fuse block under the hood for alternator/fan/headlight fusing
and I have used the extra slot for a 60 amp dual battery bus
but this might not be worth it if you are only installing one
radio.

Note: You are probably better off grounding the radio to the
floor-pan or firewall rather than all the way to the battery.
Avoid wires/fuel/brake lines and the CAT converter. If you
need better grounding, add straps to the frame. Running
your ground lead all the way to the battery may compound
your noise problem, and may blow the fuse without you
realizing it and you'll be grounding through the coax braid.
DO fuse the + lead in the engine compartment if you go to
the battery.

Hi All!

I read with interest the posts about the Kenwood 2000 having bad IMD transmit specs.

I want to upgrade my shack to an "all in one radio" and the 2000 looked like the best radio for that purpose. The reason I don't consider the Icom 746 is because it's missing 70cm. From what I heard from the Icom reps at the hamfests, Icom is not interested in adding 440mhz to a 746 like radio. Too bad! From every 746 owner I've talked to, the 746 is the top of the line. I'd run up the bill on my credit card in a second and buy one if it had 440mhz. *sigh*

I've read just about every post on the TS-2000/FT-847/IC-746 on the web and it still doesn't help making a decision.

Any new thoughts? Should I just get a 706mkIIg and wait?

Thanks for the opinions, it's great getting information from people that know way more than I do, and have owned the radios.

Thanks!
Mike

I have the 756pro and the MKIIg and love them both. The only thing I
would advise for the MKII is to but in the SSB filter when you get it.
The bottom line is if it feels good to you then go for it.

Good luck and 73, John w1hzh

Hi all:
I just received a TS-130 and it needs a little work..
There is a BROWN wire on the right side board, that the bandswitch is
mounted to..
It seems like it comes from the front bandswitch, and is about four inches
long.
It has a push pin on it.
Anyone know where it goes?
Not on a 120s.
Frank

John,

I hope you are installing a VHF or UHF rig and not a HF rig in that new Chevy. If it is a 2001, you can forget about using your HF rig while the motor is running. No matter what noise reduction and grounding you do, you will not get the ignition and computer noise down below S5+. That doesn't include the fuel pump which the only fix is to drop the fuel tank completely and filter at the pump.

This has been confirmed by Chevy after a year of constant attempts to remedy the vehicle RFI problems. Chevy is more concerned over YOUR radio interfering with the vehicle.

Reading the above -- this is why some people own two radios :-)

You could buy a 746 and a dual bander for 144/440 -- for less than a ts-2000.
Then you could monitor vhf **while** you play on hf. Not a bad way to go. Just
get a big enough power supply to run both radios. I think it would be a better
setup than an all-in-one box...

Have fun, making your choices...

It sounds like what you want is a converted commercial rig. You can get a GE Mastr II or a Motorola Mitrek for $50. They are available in 100+ watt models. Add an additional $20-40 for crystals and you have a bullet proof packet rig.

You have a bizarre sense of humor! CB Module? C'mon People are not that stupid if you trolling you better find another line.

The fact remains in anybodies language the transmitter has very poor 3RD order IMD. Maybe you think this funny and you willing to defend a company who turns out such a product. If you not familiar with transmitter 3rd order IMD i suggest you do some research.
Or better still look at the Radcomm review and see if that in your book is a good figure. It certainly is not.

Maybe you should read G3SEKs web page and learn something about IMD rather
than defending companies with lousy products. If you have a TS2000 maybe
you can tell us if Kenwood has improved the subsequent versions, you seem to
be in the "know"

Mike,

Are you looking for the perfect radio? Sorry, the perfect radio doesn't exist. If it would, everyone would buy it probably. The TS 2000 is versatile and has almost all the options included as a standard. Great radio. If you want to use the radio in your car you better buy something smaller and less delicate. Main question is what you want to do with the set and how much you want to spend. FT847 is a nice radio but in my opinion the TS2000 is far superior.

Radio's with IF DSP have sometimes not as good IMD specs compared to conventional filtered radio's. The simple explanation is that the processor should be fast and big enough to sort out complex signals and filter them real-time. And there are limits to that like in every processor. In daily operating practice it's no problem. But if you have lots of strong signals around you in the HAM frequency bands you might have inconvenience but in general the advantages of IF DSP are far greater than the limitations of a conventional filtered radio which have maybe better IMD specs.

'73, Adam

I need to replace the internal speaker for my IC-2410H and am unable to locate one. I have tried Jameco, MCM, etc and can't find an exact replacement. It has a very thin profile (slightly less than 1/2") and is 2 -1/4" wide. I have priced one with ICOM and am trying to find a cheaper substitute. Any suggestions? Thanks.

FS: Mint Icom IC-746 HF 6 & 2 Meter Radio.
This unit is just over a year old and in clean and perfect condition, like new, no scratches dings or rubs etc. This unit has never failed or been serviced. It has been in a clean, non-smoking environment and ran conservatively. The original box, manual, mic, accys and unsigned warranty card are included. If you like mint gear you will not be disappointed. Price $950 shipped CONUS. Ph: (509) 710-8759 Oh, reason for selling: New IC-756ProII took its place : -) 73 de KI7HM

Just a word of caution -- I have a switchable 1.8 khz filter in one of my rigs, and audio is awfully muffled through it. I found it to be a waste of money because it is so unpleasant to listen to. Whatever you do, make sure you can switch it "out" when it is not needed for heavy qrm.

My Yaesu has gone dead. Was working fine, turned it off. Came back a few days later (not plugged into antenna) and dead.

1) Fuses in power line ok (tested with meter)
2) Fuse in rig ok (tested with meter)
3) Power getting into rig - tested voltage on main lines behind the plug.

I am aware of some users having problems with the power switch. Is there anything I can test to see if this is the case. ?

Ideas anyone

4566. D104 Preamp Question.....

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-16 19:53:21 UTC
From: Frizz <kg4ivt@hotmail.spamsucks.leaveme.alone.com>
Message-ID: <Re0z7.7936$%B6.1588484@typhoon.southeast.rr.com>
Source record: 53370

I have an broken older style D104 desk mic. I would like to use the preamp inside of it for another application. However, I am clueless as to any of the connections that go to the preamp board. I have figured out several grounds and one connection for the mic head. This is the older style preamp that uses two transistors on a small, thin board that is attached to a strip of connector lugs. Here's what I have although I believe this thing may have been rewired:

Blue Wire: Left leg of pot to board
Orange Wire: Center leg of pot to board
Purple Wire: Right leg of pot to board
White wire: goes to board and is connected to clear covered mic cord wire.
Green wire: mic head connector to board
Brown wire: ground and mic head ground
I also don't have any connection for power.
Any ideas? Any help is appreciated. Thanks!

Date: 2001-10-16 23:24:14 UTC
From: willy <willyacht@yahoo.com>
Message-ID: <vg3z7.9575$e5.86341@newsfeeds.bigpond.com>
Source record: 53379

Well it was not me that crossed posted it. I replied to one of the posts that had all the newsgroups in reply header i did not realis this till i got nasty emails.

As far as the vendette against Kenwood, nothing could be further from the truth. All i was concerned about was the poor transmitter HF IMD thats all. God i have owned many Kenwoods including the TS870s. I get the same accusation when i criticise the Icom PROs poor receiver, i must have a vendetta against Icom as well then. If you think what i am saying is lies, just read the Radcomm Review and QST review and tell me in your humble opinion if that transmitter is good.
I read the review of the RCI rangers and their IMD figures are in that league, and you seem to get offended by the "CB"comparison because in reality that radio the TS2000 is as filthy as CB radio IMD wise and its close to a CLASS C transmitter. So if you think this a vendetta you wrong. You would not like me harassing you on the air telling you that you signal stinks and you should shut down. What you going to tell me i have the lates and greatest TS2000 and its wonderfull radio that does not splatter? Cmon get real, if you want to turn a blind eye to this fault because you own the radio. But the reality is that you will be doing you fellow amateurs a disserves.
Willy

Adam

We not concerned about tha receiver architecture at this moment. I am strictly talking about the transmitter 3rd order IMD which is well below spec. This poor IMD results in a broad signal that could be called dirty. I understand your logic behind your choice of radio and the reasons you have. I have no comments on that. All i was pointing out that the transmitter is dirty, it it does not even meet any minimum acceptable standard. You might be happy with dirty HF signal, i would not be.

Easy:

LOOK UP your Vehicle radio anti theft code if you (or the dealer) has set one. You will need it to get the sereo working again. Check the manual on how to see if there is a code or how to set or reset it if needed.

Remove the battery (hot or ground).

Remove the brace to the fender.

Remove the cover to the fuse box.

Remove the screws (or clips) inside the fuse compartment and you will be able to get to the positive studs. I think its a 7mm nut that fits the studs(can't remember), but they are cheap. Use either "A" or "B", and insert the appropriate maxi-fuse.

You can do this without removing the brace, but it is easier if you remove at least the fuse box side of the brace.

Good luck.

4583. fs: Many types of QRPp related, assembled circuit boards, CHEEP!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-17 03:19:20 UTC
From: rlucch2098@aol.com
Message-ID: <20011016231920.01557.00000329@mb-mp.aol.com>
Source record: 53387

Hi All;
I have a bunch of Circuit Board kits which have already been assembled by someone.
They are really nicely made on Copper boards with nice bright soldering.
They are mostly for 12vdc operation and all come with a hand drawn schematic.
All are very similiar to the pictures, some may vary as far as component colors, board sizes & component placing.
All components appear NEW!
I am not a designer or a technician so please check the pictures before E-mailing me or asking questions because I may not be able to answer them completely and I do not know the Power output of any of these devices or even thier uses. The Prices are with US Priority Mail included.
These items are mostly for Experimenters & hobbiests.
If you need more then one(1) item, please e-mail for Better Total cost!
Please repond by using the Item number that is written on each circuit, this will make it easier for all as they are many which look alike & are confusing ;-)

1)- 80 meter QRPp transmitter, xtal controlled, 3 transitors, 4-3/8" x 3-3/8", $13.00ppd.(1 Avail)

Why? If you're in any metropolitan area, scanners are great tools.
You can be chatting away on one repeater, and keep track of activity
on several others. I tend to use my HT for that, since it can monitor
multiple frequencies easily, but I still keep a PRO-76 around for
listening, and so the YL can monitor from home when I'm out. (Her HT's
kinda limited, and I always take mine with me)

Where do you live? Are you in or near a major city? We can check for
your local area repeaters, and that way you'll know what to look for
in a radio. If your area has a lot of 440 activity, then a dual-band
radio would be well worth your money. If everything's on 2m, then you
may want to keep it cheaper initially.

Post your approximate location, and I'll get you some repeater
frequencies that you can monitor with your scanner to find out where
the activity is at.

Willy,

I thought I was replying to a guy who couldn't make up his mind about which radio he would buy. Now I get your reply where you accuse me of supporting the use of radio's with specs. that don't meet your standards. Who are you and why do you mix yourself into an innocent question and an honest answer about somebodies experience whith a nice radio?

I understand that you think that the signal that the TS2000 produces is not clean enough and not meeting your standards and you seem to be very convinced about your being right and everybody else being wrong about it.

To which standard do you compare? Did you measure yourself or are you referring to a test by reliable technicians or and institute?

The TS2000 has been approved all over the world an went through very critical tests. Even in Germany the most critical magazines have done the test and don't make the conclusions I read in your reply.

So I believe the clouds aren't as dark as you describe them.

Source record: 53299

I have the same TS830/VFO230 setup. You don't specify the conditions when the VFO jumps. I occasionally have trouble when there is a lot of RF in the shack on 24 Mhz.

Perhaps the optical encoder is dirty or worn, or you have bad connections in the cable.

There is a known issue of poor grounding on the audio board (there should be star washers between the board and heat sink) but I don't know if this involves the outboard vfo.

4604. TS-820S ALC problem

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-17 19:27:22 UTC
From: Jungwoo Lee x5362 <jungwoo@lucent.com>
Message-ID: <3BCDDB99.F220A763@lucent.com>
Source record: 53308
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I recently purchased a used TS-820S. The Rx part is working OK. But when I tried to transmit (in SSB, CW, and tune), the ALC meter always hits the maximum (it actually bangs to the restraint bar). I could still make a QSO in CW and SSB so there is a reasonable Rf output even though the ALC meter bangs. I am concerned about whether I am overmodulationg my signal.

Could it be that the driver tube (12BY7) needs to be replaced or is there something wrong in the ALC circuitry? Does anyone have any thoughts on how to fix this problem. I am fairly well versed in electronic circuitry.

I'm in Newark, Ohio and I have a bunch of the repeaters here. I guess I neglected to say that I have 4 scanners. So if I get rid of 1 or 2 it wont really kill me. I have been into scanning for about 6 years now. and Ham just peaked my interest for a long time til I decided to do something about it.Thanks for the advice!

One of the early posters to this thread was citing the IMD numbers
tested in the ARRL lab and reported in the QST product review. On HF,
the worst band was -27dB. This is not awful since many rigs are only in
the -30dB or so range but certainly not great for a new design. However
on 6 and 2 the values really are awful. Six meters was given as only
-20 dB and two meters at -22 dB. 70 cm was comparable to the worst HF
performance. Personally I would not want to have a 6 meter user
anywhere near me.

Thanks for your reply John but do these figures meet the acceptable levels for USA type certification as per FCC specifications? That was the crux of my reply to 'Willy' ..... I don't think Kenwood would be permitted to market the TS2000 stateside if it did not meet spec.....not 'Willy's spec" but the FCC's spec...

Source record: 53314

There is an FCC spec on total spurious emissions which I assume the TS2000 met. The ARRL report gives these measurements and references the relevant rule section.
I don't think there is a FCC spec for the IMD since that is in-band emissions. (I am sure someone will cite a rule if I am incorrect here.)However for many years a value of -30dB was typical and accepted by most amateurs as the acceptable limit. Very few tube rigs did much better unless they included negative feedback in the final amp like COllins. Early solid state rigs were often poorer but almost any modern rig (i.e. less than twenty years old) would generally meet the -30dB figure. Some do better, particularly those using voltages higher than 12V.
The numbers for the TS2000 on HF I would call acceptable but not good. The worst case cited was for 160M. The VHF values really do justify the name calling of dirty. -20 dB is just way too high. I think that most hams given this value, especially in comparison with other rigs, would (fairly) call this an unacceptable level.
John
PS I am not a Kenwood basher. My HF rig is Kenwood and it was not my first from them.

Well, if you hear dead nothing ever on the 440 machines and don't
really intend to try your hand at working satellites anytime soon,
then you may want to go with something in a 2m-only rig. The HTX-202
seems to be the standard for this, even though Rat Shack no longer
carries it. Expect prices to start around $60 for the radio itself
with one battery pack, and go up from there depending on included
accessories.

If you want 440 capability, then go for a dual or triband rig. For a
mobile rig, everybody seems to like the Kenwood TM-G707. I have one,
and it's a darn good rig for general use, without the expensive bells
and whistles, but with great performance. I don't have much in the
way of opinions on dual band HT's since I picked up a great deal on a
Kenwood TH-D7A and haven't really paid much attention to the others.
The D7A tends to cost more than most beginners want to pay, since it
has the built in TNC and some other functionality a lot of us may
never use. (There's about five or six features I still haven't
used...yet)

I don't see any 6m repeaters very close to Newark, but that doesn't
mean there won't be any FM simplex activity there. If you see a good
deal on a tribander that includes 6m, it could be worthwhile.

For 2m, looks like your closest will be the 145.37 and 146.88MHz, with
possibly 146.835MHz as well. 223.94MHz may show a little activity,
but the only way I know of to get a very good deal on a 220 rig is to
get it as a 2m+220+440 triband. In the 440 band, you should be able
to hear something on 442.05, 444.50, 444.65, and 443.925. Of course,
you know more about your area than I do, and you probably already have
an idea of the terrain effects on these bands near you, so try to get
a current copy of the ARRL repeater directory, and see what other
cities you can pick up, then decide who you want to talk back to :)

Source record: 53320

A colleague of mine recently had his 500MHz business band repeater go up in smoke, and wondered if I could find him a replacement. I never realized how hard it was to find used 500 MHz equipment... or even new equipment for that matter.

Can anyone give me leads on used/new 500 MHz repeaters? He'd like to stay at the 100W power level, and would consider new. Who makes new repeaters in this range? I looked at the specs on the Motorola MTR2000, but I don't see a 500 MHz version.

Also, what is the rough cost of an MTR2000 or Quantar repeater??

Dunno. How are the readings in the other meter modes? IP,HV , etc? Do
they seem normal? Should see about 60 mils idle, and load up to about
200-220 mils or so full tune. It's hard to say really. Does the ALC
bang the peg no matter what drive level, or does it only bang with
full or max drive? Bangs the peg with normal voice? It shouldn't do
that...I was thinking processor, but that shouldn't effect CW. Dunno,
it's hard to say. But doesn't sound right if it does that all the
time, no matter the drive level. Not sure about the tubes.. I would
think it's probably an ALC circuit problem, but I wouldn't rule out
the tubes. I've seen stranger things happen. Maybe you can find some
6146's and a 12by7 to try as a test. Many people still have old tubes
laying around. But you may have a circuit problem somewhere.You may
need a service manual to get some voltage check points to try. MK

Your best bet would be to see if your county has an EOC (emergency ops
center) usually manned by amateur radio folk in the event of an emergency.
(here in the midwest, tornado season keeps it occupied a bit.)
Do a web search on your county for amatuer radio clubs, or EOC.
From there, the local operator(s) should be able to tell you what
frequencies are used for emergency communications. In a national emergency,
often times it would be these local centers taking local info, and
coordinating with the appropriate people. Rarely would you be calling
california to report a problem in ohio.
There have been a few grass roots movements to establish emergency radio
operation plans in all services, including CB and Family radio service,
however the coordination with local authorities is usually left out of that
loop. An exception was hurricane andrew, when the emergency amateur radio
operators relied heavily on cb'ers, manly because the vast majority of
folks there were able to communicate easily with them.
Again, try your local EOC, they can usually let you know where to start.
If you wish to get your amateur license, it's a simple test, no code, at
least for the beginning license.
Good luck.

John

You sound like what you need is an "Elmer." That's what we call a ham that helps newcommers to the hobby. If you post your location and how to contact you off line, I would bet that someone local will contact you.
Briefly:
There are nets that meet regularly to pass traffic. In the event of a national emergency these nets would activate. Local emergencies would most likely be coordinated on a local repeater. The frequency would be specific to your area. Most long range communications would be on frequencies below 30 MHz and most local communications would be in the VHF or UHF spectrum. Most any general coverage short wave receiver will allow you to listen to HF communications as well as short wave broadcast stations. Many of us started out as Short Wave Listeners (SWL) before getting our ham license. I started by building a three tube radio from a kit as a teen ager. Ham band specific recievers will make it easier to tune the ham bands and scanners such as those sold by Radio Shack will allow you to monitor VHF and UHF communications as well as police and fire communications.

It is easier then ever to become a ham radio operator. The entry level license (Technician) gives you access to the VHF and UHF ham bands and is available for passing a short test requiring a little technical knowledge to keep you safe and knowledge of the rules to make sure you don't accidently do something wrong. Again, a local ham club or individual can help you with what to study and where to take the test. To gain access to the HF region you will need to pass a 5 word per minute Morse code test and a little more difficult written exam. You don't have to be an engineer to be a ham. One of the great things about the hobby is that you will meet people from all walks of life on the radio. Those that have more technical knowledge help those of us that don't.

If you post what town you are in, I'm sure someone local will contact you. Then you will "personally know" someone in amateur radio.

Gene

Mark,

Thanks.
All the other meter modes (IP, HV, etc) are normal. I get 60 mils for IP, and about 800V for HV. From SWR power meter, I get about 100W RF output (in CW mode), which kind of indicates that the two finals may be OK. The ALC meter bangs the peg no matter what the drive level is (both Tune and full-power CW mode). In SSB, it bangs the peg whenver I start speaking to the mic. The funny thing is I get 59 signal report in my QSO even in this condition. The speech processor is off so it shouldn't be a factor. BTW, my antenna SWR is about 1.3 so it shouldn't be a factor either.

-Jungwoo Lee/AB2ND

Dunno. How are the readings in the other meter modes? IP,HV , etc? Do they seem normal? Should see about 60 mils idle, and load up to about 200-220 mils or so full tune. It's hard to say really. Does the ALC bang the peg no matter what drive level, or does it only bang with full or max drive? Bangs the peg with normal voice? It shouldn't do that...I was thinking processor, but that shouldn't effect CW. Dunno, it's hard to say. But doesn't sound right if it does that all the time, no matter the drive level. Not sure about the tubes.. I would think it's probably an ALC circuit problem, but I wouldn't rule out the tubes. I've seen stranger things happen. Maybe you can find some 6146's and a 12by7 to try as a test. Many people still have old tubes laying around. But you may have a circuit problem somewhere.You may need a service manual to get some voltage check points to try. MK

Probably ALC meter adjustment. Its hard to screw up the
ALC action. As I recall, tune for maximum CW output, then reduce drive for a 10% reduction in output power, then adjust the meter
to read midscale.

Hi Greg,

Go to some of the Amateur Radio Mods and Conversions web sites to find the conversion of the MSF 5000 to amateur service. Although a bit of a bear to mod, the msf5k works pretty well in the ham band. The conversion information you locate might allow you to hook your external controller up.

The Oakland.edu web site has lots of conversions, some of the links from repeaterbuilder might also bear the information you need.

The Zetron Manual should provide many examples of wire/hookup information that will get you through the second half. They seem to be pretty well done.

Hope that helps... I do mostly msr 2000's and the conversion I have done is listed on the http://sonic.ucdavis.edu Amateur Radio Pages

cheers
skipp

One can make a quality 500MHz repeater pretty easy. I just made and sold a new unit to a guy for $1400, most of that cost was related to the higher power level. A 25 to 50 watt unit probably runs about $850 plus any controller logic you might want.

cheers

TS120 has a very different ALC circuit.

Sounds like you need to get the manual and start digging, but it sounds like the metering circuit.

Hi there,

Remember the typical D-104 mic head is a crystal cartridge... that's a
high impedance, so the circuit is probably a fet type transistor. On
older mics, the wiring diagram used to be on the mic base.

Might be simple to sell the mic on the news groups/Ebay for parts, then
build your own new unit that fits what you might need (better). Consider
an Electret or dynamic type mic cart as an alternative.

cheers
skipp

I used to love those little Curtis 8044B keyer IC's. You could build a nice simple iambic keyer on a 1" square piece of Vector board. Alas, they've been out of production for many years now, and I wasn't smart enough to stock up on 'em when I had a chance. What are you guys doing for keyer chips these days? I need some kind of keyer IC that I can build into a QRP rig, so it has to be really small. I'm familiar with the LogiKey memory keyer family from Idiom Press (I built their CMOS Super Keyer II back in 1990 and it's still my main station keyer to this day). They're way too big for what I have in mind. I've heard of the TiCK units, but I don't have any details on them. Whatever I end up with must be simple, tiny, battery powered, low power consumption, and easy to use. Ideas, anyone?

It's okay to post your responses to the newsgroup, so that other inquiring minds can share the wealth of information.

Message-ID: <3BCF30E9.548DFDE8@swva.net>
Source record: 53259

I am interested in selling or trading my 30S1 and some associated parts. I have owned it for about nine years and purchased it from K2BF (SK).

The 30S1 is S/N 678 (WE) and is in good condition. There are some mild scratches on the top and sides and there is a minor dent on the wire cage covering the air vent at the rear. The front panel is extremely clean and unmarred.

The unit has been modified to deliver 1500 watts output on all bands including the WARC bands (100 watts input). This modification was accomplished by the well-documented procedure of increasing the screen voltage through the addition of additional windings to the secondary of the screen supply transformer by means of a second (isolation) transformer. It is easily reversed by merely loosening several screws and removing the second transformer's leads from the main transformer's terminal strip.

The original three-minute time delay relay has been replaced by a homebrew unit which works flawlessly. (I have two nonworking original relay units also.) The bias transformer was replaced (or rewound and replaced) about six years ago. One or two of the original cartridge-type diodes have been replaced with more modern wire lead units. The HV rectifier tubes have been replaced by solid-state plug-in modules. When I took the amplifier off the air about five weeks ago, it was working perfectly.

I am also including in the package a spare, unused 4CX1000A and socket. The tube is an Eimac reject which was given to me by a good friend. It was rejected for cosmetic reasons and not performance. I have not checked it. If it should turn out to be NG, I will return $150 to the buyer.

In addition, I have a file on the 30S1 which includes many good articles and tips, a copy of an early manual and an original more recent manual.

I would trade the entire package above for a clean, working, modern 1.5 KW output amp. The TenTec Titan 425 would be ideal, but others are certainly acceptable. If necessary, unequal trade conditions can be adjusted with cash. Otherwise, the price is $1,600 with a pick-up in southwestern Virginia, about 40 miles southwest of Roanoke.

You can contact me via e-mail or anytime at 540-745-6825.

73, Joe

The normal tone connection is on the main board. It's just a row of pins
that take the molex connector from the tone unit. But, there's also an audio
interface connection that can be used on the "input" board. Dont remember
which one you've got, but used to keep a bunch of them running for the
fone company.

> so it shouldn't be a factor either.

It sounds normal except for the ALC action. Something is not right
there, thats for sure. I think it's possible for the reading to be
near full scale," my 830 and other 520's have been near full scale at
full drive", but it should not have any reading with no drive. So you
have a problem for sure. I'd check the power supply voltages just to
make sure it's ok."3.3, 9v" Then I'd start looking through the alc
circuit. I'm curious...Does adjusting the drive change the RF output
level even though the ALC reading stays pegged, or does is the drive
level "pegged" all the time also? IE: in tune, lowering the drive to
zero, should lower the rf output to zero when in tune or cw. This is
one I'll have to think about for a while... MK

Yes, the power switch is a big problem. You can check it by unscrewing the front head of the rig, swing it down, find the solder points of the power switch pins on the exposed circuit board and jump them with a piece of wire.

it all depends on the model..
but as a general statement i would guess that a modern ham xcvr has as good
or better than the sangean sw rx..
you can use the a good ham xcvr or rx for am using ssb but you won't get
good fidelity..
if you want fidelity you'll need a wide band filter..
if you get a a kenwood 440 or icom 735 for around $400 you can use it after
you get your ham license..
go to a ham fest or watch ebay..
good luck..

4658. ??? Ameritron ALS-500M ???

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-19 04:08:42 UTC
From: Gary - KJ6Q <davison7@gte.net>
Message-ID: <eHNz7.555$6R6.96208@dfiatx1-snr1.gtei.net>
Source record: 53262

I just bought a new Ameritron ALS-500M 600 watt mobile solid state amp - and while it works quite
well on 160-40 meters, the output falls to 300 watts on the phone portion of 20 meters and above -
it has near full output on the very lowest portion of the CW band on 20, but falls off quickly to
the 300 watt level much above that frequency including 17 and 15 meters. This is all with well
matched antennas AND also into a dummy load - all with stiff DC applied well above the current
demand needs of this amp. Any other ALS-500 users out there having the same "problem" with their
amps? Is this typical for this amp? Is there any "fix" to get full output at LEAST on the phone
portion of 20 meters - my main mobile operating spectrum?

Please give ME the benefit of the doubt - the problem IS the AMP, not me or the installation -
HONEST!

All pertinent comments appreciated - please reply via Email as well as here so I don't miss your
response due to frequent ISP glitches... Thanks...

I have for sale a Bird 43 wattmeter. Also with it I have 4 slugs. They are: 100c(100-250MHz 100w), 10c (100-250MHz 10w), 25d(200-500MHz 25w), and 250c (100-250MHz 250w). I am asking $200 for the complete setup. I will split shipping costs with someone that buys it if they are in the lower 48 states. It works and looks good. It has some chips on the paint, but otherwise in nice condition. It also comes with the manual from Bird. I am in CT. Thanks, Gary

Gary,

Why don't you ask your question directly to Ameritron's helpdesk? They have
a very good telephone service and I'm convinced that they are willing to
answer your question.

It sounds to me that your powersupply or car-battery can't meet the
expectations of the amplifier or drops Voltage. Can you measure the
max.current that the Amp is using in CW or FM? The peak current in SSB might

be difficult to measure with standard equipment. What kind of powersupply are you using?

It can also be that the SWR between the rig and the Amp. is not good on the higher bands. Did you measure the SWR between the transceiver and the Amplifier? Did you check with different rigs? The ALC might decrease the drivingpower to the AMP.

If you are convinced that everything is done according to the requirements than your Amp. might be defective.

'73, Adam

4662. Pro/Con for kenwood TH-G71A v.s. Kenwood TH-F6A v.s. Icom W32A

Source record: 53266

Howdy all.. Looking for some input. I think I've finalized my choice
of HT between the above 3 radios.

My needs are:
800 RX (867.XXX and 856.xxx)
extended UHF RX (485.XXX)
RX Sensativity.
Extended TX a plus (151.625 for CALCORD)

So so far, the G71 and W32 have dual recieve, however the G71 won't
alow seperate volume controls like the W32, which is no biggie.
However will any recieve up past 469? What mods are available?
222 is not a big issue.

Any help appreciated.

Thanks.

Mark---

> in tune, lowering the drive to zero, should lower the rf output to
> zero when in tune or cw.

This is not quite right, at least not on the 830S that I have. On my rig, the drive adjustment simply adjusts the drive tank circuit, matching it to the final input. On ALC in TUNE, DRIVE peaks with relative sharpness, and on RF, peaks broadly. There is slope on either side.

Knob to check: CAR (carrier level). On the 830S I have, it sleeves around the MIC (mic gain) knob. First, turn it fully counterclockwise, then check to see if the same activity occurs. You should get a very small or indiscernible peak on ALC when adjusting DRIVE. If your meter _STILL_ pegs, then its time to look at the circuits involved.

Good luck,

Henry C. Gernhardt, III

HARRIS GATES HFL-1000 FLOOR CONSOLE AMPLIFIER. Own a piece of history. Rack mounted amp, Rack mounted matching powersupply in a waist high matching cabinet. 4 (FOUR) Roller-inductors, PA-Tune/PA-Load/Input-Tune/Drive-Tune. ALL BANDS! 160-10M with perfect input and output matching. Fully monitored, Step-start and a full set of factory safeties. Currently being used daily with a full output Eimac 4CX1500A, will come with a SPARE full output Eimac 4CX1500A along with the original 4CX1000 with full out. This AMP was built to military specs and will last a lifetime, full set of schematics and manuals. Both amp and power supply slide out and rotate down while still connected to cabinet for access or repair, (awesome)! The amp has been upgraded to a current radio solid state keying circuit. Please email with questions or for additional info. This is a Central Texas Pickup only! Entire unit weighs 400 pounds and I will not ship! $1200 takes it all. AC5YV@hot.rr.com

4673. Re: ICOM Dual Band

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-19 13:42:34 UTC
From: Patrick Mason <Jimmyk@mindspring.com>
Message-ID: <9qpafh$71p$1@slb3.atl.mindspring.net>
Source record: 53277

I have two Yaesu's and three Icoms with one Kenwood HT. Right now I would not have a Yaesu if it were given to me.

Not because the workmanship is bad. Although the thin circuit boards on the 847, 8000R & 8100-r caused numerous solder joint problems and failures, the majority of their line appears fairly reliable. (that discounts the first batch of FT-100's).

If you want service from Yaesu you are out of luck. If you can get 60 day turn around... good luck. I just had on of my 8000-R's serviced. They did not log it into their shop until a week after UPS dropped it off and they signed for it. It then took a month for them to work on it and another two weeks to let me know about it, (I had to call them each time to check on it, they never called me or sent me any information).

Friends tell me they have let most of their staff go to cut costs. With the service I get from Yaesu, I don't doubt it. The idiots are discontinuing two of the best rigs they have ever built, they have already dropped the FT-1000MP in favor of the MP, MK. V and the FT-920 has stopped production.

Just sent in my Icom 821H for some tuning and bulb replacement and a VFO problem. The Icom folks had it fixed within 48 hours of logging it in from UPS and within 7 days they have it back en route to me.

Hmmm two month turn around with Yaesu..... less than two weeks with Icom. My choice has been made.

The Curtis 8044 is out of production, but the 8045ABM (an improved version with selectable A and B modes, code speed meter, and memory) is still available from MFJ (http://www.mfjenterprises.com) for $19.95. If you want to build a traditional keyer with knobs for speed and so forth, you might prefer this to the PIC-based keyer chips that others have mentioned. The PIC keyers all use mode switches and paddle input to control this stuff; great for installing the keyer inside a rig where space is at a premium, but perhaps less convenient than old-fashioned knobs for an at-home keyer.

4675. Re: TS-820S ALC problem

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-19 13:52:19 UTC
From: Jungwoo Lee <junglee@alumni.princeton.edu>

When I adjust the drive knob in Tune mode, there is a certain range
where the ALC meter pegs. At other range of the knob, I got 0 ALC meter
reading. This means that it is doing some tuning. Another thing is that
the Carrier knob does not change the RF output in CW mode at all. I
don't know whether it is related to the ALC problem.

Probably. Check if the drive adjustment gives you a broad peak when the
meter is in RF mode. Be this the case, your drive cap is fine. Based
on what you are saying, I would suspect either the mechanical linkage to
the carrier adjustment pot, or the carrier adjustment pot itself.

Good luck,

Hey -

Eventually, if I get the money, I'd like to get a used Yaesu FT-726R VHF/UHF all mode rig. If I get one, I'd like it to have the 50/440 mHz band modules, satellite duplex and tone boards. My question is, if I see one that doesn't have all the accessories I want, should I get it and look for the accessories, or wait until I can get one that's loaded? I mean, how hard is it to find accessories for this radio?

73s,

Hi fellow Amateur Radio Ops
The Clear Lake ARC will hold HamFest 2001 on October 20th.
We have great door prizes (ICOM 706 MKII G, T81 quad band HT, and an Alinco power supply)
Entry is $3/person (kids 12 or younger free if accompanied with an adult)
Buy lots of tickets ($1=1 ticket, $5=6 tickets, $10=12 tickets, $20=25 tickets)
We have lots of vendors and ham sellers. In fact all tables are currently sold out.

www.clarc.org/hamfest.htm has maps, directions, prizes, and more

This Hamfest is all inside the Bay Area Community Center (NO OUTSIDE TAILGATING ALLOWED!)

See you THIS SATURDAY OCTOBER 20th, 2001

Rats! I'll have to go to the car lot with a transistor radio
next time. I got s3-s7 depending on open-loop closed-
loop. Also I have a problem in one cylinder that's
raising the firing voltage. I can hear that one pretty well.

Maybe I'll leave the socialist republik of kalifornia and put
a V8 in. BTW, BIG TIME purge going on here for reap-
portionment. Flag waving has nothing to do with patriotism.
It's just for show. State testing, registration and licensing
now required to buy/own firearms. DD-214/active military
no longer valid exemption. All guns currently in possession
must be registered. Known gun owners are now being
harassed and forced out of work, apartments, and gun
control advocates are asserting that guns are for suicide.

Gang bangers and felons are overjoyed because none of
this applies to them, having obtained theirs via black-market
sources, and the sheep are unarmed.

All this because several of our representatives ignore volumes
of negative mail, while they make their own rules and
fear of crime instilled by the media is the main motivator.

Also, now community college tuition can now be
subsidized for undocumented aliens (out of state property
taxes). I wonder if that applies to terrorist training or is it
just for foreign nationalist operatives?

California can now be considered an incursion into USA.

Same thing I meant. What I called drive, I meant as the carrier level. I guess a bad choice of words being as they call the preselector "drive". MK

4692. Yaesu VX-5R versus Kenwood TH-F6?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-19 21:08:01 UTC
From: Martin <marting007@earthlink.net>
Message-ID: <RC0A7.2851$SP.351301@newsread2.prod.itd.earthlink.net>
Source record: 53296

I was all ready to buy a VX-5R back in August, but decided to wait until the new Kenwood HT came out to see if it would be a better machine. The few responses I have gotten from new owners of the TH-F6 have been lukewarm reviews. So, I'm again requesting input from anyone with experience with these HTs. From what I've heard so far the Kenwood does not seem to be worth the extra $$. I'm again leaning toward the Yaesu, unless anyone can convince me the Kenwood is better.

Thanks!

Ok, Then you have a problem. The "drive" as they call it is pretty
much a preselector. So in your case that is working properly. It's
your carrier control and related circuit which is not acting right.
That should be controlling the drive level, and should drop the output
to zero when it's all the way to the left. It could be related to the
alc. Probably is being your alc indication is very high. I'd start
looking around that point. Somethings not right, thats for sure. MK

Sold my VX5 two weeks ago and got a TH-F6 last week. So far, no regrets. I've had very little time to play with it but so far I like it a lot. I'll start with the negatives:

THe TH-F6 has a concentric volume control below the mode change knob. I find it too easy to accidently change the volume while turning the top knob. I'll get used to it, though. Also, the buttons on the Kenwood are a bit smaller than the VX-5. They're actually a bit wider, but less tall and just a tad harder to hit individually... but not much different than the Yaesu.

The positives: One of the reason's I changed HTs if that I wanted the broader Rx range and also SSB receive. I got what I wanted. The SSB receive on HF is great, considering all it has is a Ferrite Bar antenna by default. The radio can be programmed to use the external SMA antenna jack for HF, though, so you could hook it up to an HF antenna and hear everything. The SSB sound way better than one would expect from such a tiny HT, plus the radio has very fine tunning and I can tune the SSB sigs in just fine for perfect audio.

I also like the dual receive capability.... unlike the Yaesu, you can monitor two frequencies at the very same time, rather than scanning. T

The battery sure is bigger, and I expect will last a lot longer than the Yaesu's, the the little Yeasu battery was pretty good, too.

This might be a bit premature, but so far, I think I find the operation of this Kenwood a little bit easier than the Yaesu, too, (better or more accurate labeling of buttons make control changes a bit more intuitive.)

That's about all I've had to check so far.

Vic -

If you go to http://www.qrz.com/ , scroll about halfway down the page; on the left hand side, and look for a menu called "data services", and a subheading called "name search". Click on that, and it will let you access a database of ham radio operators (this information is public domain). Just enter the name of your hometown, or the towns around you, and it will return with all the names and mailing addresses of hams in your area.

Making a PIC-based keyer with a knob for setting the
speed is easy: have the knob adjust the processor clock
frequency (say, a pot in an RC oscillator). PICs are
static inside, so you can run the clock as slowly as
you like.

What other knobs would you need?

:
: Ok, Then you have a problem. The "drive" as they call it is pretty
: much a preselector. So in your case that is working properly. It's
: your carrier control and related circuit which is not acting right.
: That should be controlling the drive level, and should drop the output
: to zero when it's all the way to the left. It could be related to the
: alc. Probably is being your alc indication is very high. I'd start
: looking around that point. Somethings not right, thats for sure. MK

If you take the Car level full counterclockwise and you have still have
power, you're oscillating. Do a neutralization, then take a hard look
at your PA and Driver/coil pack assy. If you have one try subbing
your 12BY7.

Hi:

I am after a Quanity of Amp Type " N " Male Plugs

Part Number UG-21 B/U [Amp 74868]

These are Nickle Plated type N Male Plug with a Silver Plated Center
Pin (These are the " Clamp " Type ===> NOT CRIMP Style

For the RG-8 / RG-213 / RG214 Series Coax Cable

I am need of a at least 20 to 100 of them.

Preferably in the Package.....Will also Consider the " KING " or RF Industires
style if you have some....

Please let me know what you may be interested in trade, or there is always
cash.

I would suggest looking into programming your own with a PiC (one-chip microprocessor). The time and expense required for building a PiC programmer and learning how to write the code is modest. This capability will probably open doors for you on future projects. The PiCs have a short instruction set and are ideally suited for this type of hardware control application.

If you want something very simple then the programming is easy. If you want more sophisticated functionality (e.g., restrospective validation of marginally-too-early fast keystrokes) then you need to spend a little more time on the software. Having said this - the only commercial keyer chip I ever tried (purchased at a hamfest) had poor performance in this respect and there was no way of modifying it - so with a little time and effort I suspect you can 'homebrew' an autokeyer to the same if not higher performance standards.

One is aimed at consumers. The Sangean and clones have
ferrite bar antennas, and will receive signals without an
additional antenna. Ham receivers will require an external
antenna.

Hi all:
I just bought an FT-100 and cannot remember the remote components necessary.
Do I need the YSK-100 remote kit only, or do I need the CT-20, MMB-62.
The catalogs are not too clear.
From what I remember, I need three cables, one for the mic, one for the radio, and one for the speaker, but where is the bracket(s) for the front panel, one for the front to screw to, and one that it snaps into when getting back into the car.

> What other knobs would you need?

Yes, that's true, if you're rolling your own. All the commercially available PIC-based keyers I know of, though, use the mode-switch and paddle entry approach. Furthermore, most of them are using the little 8-pin PICs where the oscillator components are built into the chip; you can use external components, but the chip has to be programmed differently to tell it so, and you lose a couple of I/O pins that you can't really spare. So you can't just take a TiCK or a K1EL chip and change the speed that way.

Back in the old days, you would see keyers with knobs for speed, weight, sidetone volume, and sidetone pitch. (I have a homebrew one built back in the early 1980s, using an 8044B chip. It has two knobs on the front - speed and volume - and two more on the back.) You couldn't do all of that with your approach. (In fact, you couldn't do a keyer with sidetone at all, since the sidetone pitch would change along with the keyer speed.) You COULD do it by using a fancier PIC with A/D converters and connecting the pots to the converters, and it might be a fun homebrew project if you're into microcontroller coding, but it's a lot easier to just go out and buy a Curtis chip if you want that sort of keyer.

True, sidetone isn't usually an issue when using a keyer with modern rigs - they all have it built in. I built mine back when I had a Swan 400 transceiver, which didn't have it. Keyer sidetone is also handy for practice sessions and code demonstrations - situations where you want to send code without involving a radio.

4727. Ham Radio Store at an Airport in Upstate New York?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-20 18:43:40 UTC
From: vtail@hotmail.com
Message-ID: <3bd1c4f4.17798482@news.netis.com>
Source record: 53232

Sometime back in the late 1970's or early 1980's, while flying from Massachusetts to Minnesota, I happened to land for fuel at an airport in upstate New York (maybe Syracuse, Utica, or Rochester).

Walking through the terminal building, I noticed that there was a ham radio store in operation there ... a fairly small one as I recall, but they had a lot of stuff.

Does anyone know the store I'm talking about, where they are, and whether they are still in business?

Thanks...

Source record: 53234
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

For sale:

Yaesu FT-101EX HF transceiver. 260 watts p.e.p. SSB, 200 watts CW,
40 watts AM on 160 through 10m plus WWV, AUX, NB, VOX, CAL etc.
Radio comes with the AC power cord, manual, microphone all ready to
plug and play.

I made several QSOs on the rig today and it works fine. The function
switch needs a squirt of cleaner, but everything else is solid.
Will sell for $265.00 plus shipping

Also have a parts rig FT-101E (includes additional speech processor
and 12V power supply built-in) - case is a bit rusty, but rig is
complete and would make a great restoration project or spare parts rig
for the FT-101EX above.
Will sell for $100.00 plus shipping

Looking for that original service manual for your state-of-the-art
1970's & 80's radio? This might be your lucky day!

We were recently able to purchase several pallets of original service &
shop manuals when a local service shop closed, as well as from state
auctions. We
have cataloged them by manufacurer and listed them up for sale on our
website.

Take a look, and let us know if something looks interesting.

> Back in the old days, you would see keyers with knobs
> for speed, weight, sidetone volume, and sidetone pitch.

After struggling with TiCK and similar keyers I longed for the knobs of my old Heathkit keyer, but then I got a K1. This has up/down buttons for speed, and simple combinations of buttons for loading and sending the memories. The mode and sidetone pitch are set from a menu navigated through the radio's LCD.

After using it for a while I realized I like this approach a LOT. It's easy and quick to change speed with the buttons, and you get feedback through the LCD, so unlike the keyers with knobs, you can easily go back to a previous setting. Things like weight and sidetone are harder, but you don't do that very often so I don't see it as a problem.

I'm building something similar for a homebrew radio using a PIC and as Laura says, it's pretty simple business. I am having a code problem at the moment but I'm sure it's something obvious so sooner or later I'll lick it.

Hello

I will be using a wire antenna fed with twin feeder and will want to use a balanced ATU. Can anyone give me suggestions for a good balanced ATU. I won't be using more than 100W, will need balanced and unbalanced inputs with S0239 socket for output. I have looked at the MFJ range and a few others but would like to hear from people that use a wire antenna with twin feeder to a balanced ATU.

Thanks

Richard

4746. FS: Yaesu FT-920 HF/6m DSP **EXTRA NICE**

Source record: 53148
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

FS: Yaesu FT-920 **LOADED**

This FT-920 is absolutely LOADED with filters from International Radio and is an excellent contesting rig.

Besides the standard FT-920 features (Digital signal processing, 100 watts on HF and 6m, dual antenna inputs, etc.), this radio has the following InRad filters: 400Hz CW, 2.1KHz SSB, 1.8KHz SSB and 6KHz AM. The InRad filter add-on board allows either the 2.1KHz filter to be used alone, or used in cascade with the 1.8KHz filter.

Near mint condition - only a couple of *very* minor scratches on the case. I've used this rig very successfully in contesting for the last 3 years; selling it only to finance my private pilot's license.

Just returned from Yaesu service today for an alignment and checkout, so it's in top shape for contesting season. Does not have the FM board, but who really uses FM on 10m or 6m?

Includes original box, manual, hand mic and power cable.

$950 incl shipping in lower 48 states.

Please e-mail martyt@pobox.com if interested.

73 de Marty NW0L

4747. FT: My Kenwood TH-G71A for your ICOM W32A (modified)

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-21 03:22:22 UTC
From: Evan Platt <none@seebodytoreply.com>
Message-ID: <lsf4tts4nhf2m60ecc9gs04lj1km3necj7@4ax.com>
Source record: 53149

Greetings.. I just picked up a Kenwood TH-G71A today at Pacificon, however my stupidity, didn't ask enough questions. I'm looking for a radio that recieves in the 480's and 800's, as I understand the older W32a's do. I already mod'ed my G71A but it doesn't include anything above 469.999.

As this is literally a brand new radio, I know I'm probably asking for much, but I'd like a excellent condition W32, with (am I pushing my luck?) a high cap battery and a drop in charger.

Any willing traders out there?

reply to evan at espphotography dot com.

Thanks.

Evan

4753. WHAT A WAY TO MAKE MONEY!!!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-21 13:05:45 UTC
From: sianifach@aol.com
Message-ID: <20011021090545.06925.00000484@mb-bj.aol.com>
Source record: 53157

I found this on a bulletin board like this one and decided to try it.

A little while back, I was browsing through a newsgroups,just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of ï¿½5.00! So I thought, Yeah right, this must be a scam but like most of us, I was curious, so I kept reading.

Anyway, it said that you need to send ï¿½1.00 to each of the 5 names and address stated in the article

You then place your own name and address in the bottom of the list at #5, and post the article in at least 200 newsgroups. (There are millions) No catch, that was it.

So after thinking it over, and talking to a few people first, I thought about trying it. I figured: ;what have I got to lose except 5 stamps and ï¿½5.00, right?

Then I invested the measly ï¿½5.00. Well GUESS WHAT!!...within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in.

In my first week, I made about ï¿½25.00. By the end of the second week I had made a total of over ï¿½1,000.00! In the third week I had overï¿½10,000.00 and it's still growing.

This is now my fourth week and I have made just over ï¿½42,000.00 and it's still coming in rapidly. It's certainly worth ï¿½5.00, and 5 stamps, I have spent more than that on the lottery!!

Let me tell you how this works and most importantly, why it works.... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it.

I promise you that if you follow the directions exactly,that you will start making more money than you thought possible by doing something so easy!

Suggestion:
Read this entire message carefully! (print it out or download it.)

Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only ï¿½5.00 (Plus postage)

IMPORTANT:
This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE:
Please follow these directions EXACTLY, and ï¿½50,000 or more can be yours in 20 to 60 days.

This program remains successful because of the honesty and integrity of the participants. Please continue it's success by carefully adhering to the instructions.

Technically, you will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service.You are in the business of developing Mailing Lists.

Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list.

Here are the 4 easy steps to success:

STEP 1:
Get 6 separate pieces of paper and write the following on each piece of paper ;PLEASE PUT ME ON YOUR MAILING LIST;

Now get 5 US $1.00 bills or 5 Uk ï¿½ coins (or if you're from Scotland, notes) and place ONE inside EACH of the 5 pieces of paper so the bill or coin will not be seen through the envelope (to prevent thievery).

Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the phrase ;PLEASE PUT ME ON YOUR MAILING LIST;, your name and address, and a ï¿½1.00 coin or $1 bill. What you are doing is creating aservice. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! If you have any doubts, refer to Title 18 Sec. 1302& 1341 of the Postal lottery
laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again.

Like most of us I was a little skeptical and a littleworried about the legal aspects of it all. So I checked it out with the PostOffice and they confirmed that it is indeed legal! Mail the 5 envelopes to the following addresses:

1) Ms Alison Claren Grange Farm Barn, Hampshire RG25 2QBEngland
2) Ms J. Ferrere 2 Hemsley House, Streatfield Road, Heathfield TN21 8LA England
3) Ms T. Hutton 14 Blunden Drive, Langley, Berkshire, SL3 8WG
4) Ms V L Pirie 94 Provost Rust Drive Aberdeen Grampian Scotland AB167YL
5) Ms S E St John 60 Erw Non, Llannon, Llanelli, Carms Wales SA14 6BL
Now take the #1 name off the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...) and add YOUR Name as number 5 on the list.
STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 2.4million groups) All you need is 200, but remember, the more you post, the more money you make!

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way.
NOTE:
You may want to retain every name and address sent to you,either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 in dark paper to reduce the risk of mail theft or if it is acoin, wrap it in tissue paper so that it does not slide around in the envelope.)

So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a ListDeveloper with one dollar or pound each.

Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of pounds inCASH!!!

What an opportunity for only ï¿½5.00 (ï¿½1.00 for each of thefirst five people listed above)

Send it now, add your own name to the list and you're in business!

---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS----------
Step 1)
You do not need to re-type this entire letter to do your ownposting.
Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.

Step 2)
Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.

Step 3)Save your new notepad file as a .txt file. If you want to do your postings indifferent settings, you'll always have this file to go back to.

Step 4)
Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.)

Step 5)
Visit these message boards and post this article as a newmessage by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the postmessage button. You're done with your first one!

Congratulations...THAT'S IT!

All you have to do is jump to different newsgroups and postaway, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part:
Out of 200 postings, say I receive only 5 replies (a verylow example). So then I made ï¿½5.00 with my name at #5 on the letter.

Now, each of the 5 persons who just sent me ï¿½1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another ï¿½25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional ï¿½125.00!

Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional ï¿½625.00!

OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies,that just made me ï¿½3,125.00!!!

Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still ONLY 5 persons per 200 newsgroups react I will receive ï¿½15,625!

With an original investment of only ï¿½5.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your nameat number 5 again. And start posting again.

The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?, JUST LIKE YOU are now!!

So, can you afford ï¿½5.00 and see if it really works?? Ithink so...

People have said, what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try?

Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. <Remember, play FAIRLY andHONESTLY and this will really work I found this on a bulletin board like this one and decided to try it.
A little while back, I was browsing through a newsgroups,just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of ï¿½5.00! So I thought, Yeah right, this must be a scam but like most of us, I was curious, so I kept

reading.
Anyway, it said that you need to send ï¿½1.00 to each of the 5 names and address stated in the article

You then place your own name and address in the bottom of the list at #5, and post the article in at least 200 newsgroups. (there are millions) No catch, that was it.
So after thinking it over, and talking to a few people first, I thought about trying it. I figured: ;what have I got to lose except 5 stamps and ï¿½5.00, right?
Then I invested the measly ï¿½5.00. Well GUESS WHAT!!...within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in.
In my first week, I made about ï¿½25.00. By the end of the second week I had made a total of over ï¿½1,000.00! In the third week I had overï¿½10,000.00 and it's still growing.
This is now my fourth week and I have made just over ï¿½42,000.00 and it's still coming in rapidly. It's certainly worth ï¿½5.00, and 5 stamps, I have spent more than that on the lottery!
Let me tell you how this works and most importantly, why it works.... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it.
I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy!
Suggestion:
Read this entire message carefully! (print it out or download it.)
Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only ï¿½5.00 (Plus postage)
IMPORTANT:

I have a total of 5 units of these main frame sweepers
Kruse Systron Donner RF Sweeper Model 5000A. Working Unit. Features include: Adjustable Horizontal Sweep Speed 0.01 to 10 seconds; Horizontal output, Manual Trigger; Adjustable Start, Stop and three Marker Frequencies; Rear Panel connectors for external Sweep, external trigger, external AM modulation, sweep output, blanking output, marker output, 1KHz output; Selectable 115 or 220 VAC input. Designed to work with Model 5xxx RF Oscillator Plug-Ins. $85 each Plus shipping

Kruse Systron Donner RF Oscillator Model 5011. 1 - 2 GHz Working Unit. Features include: RF Attenuator Control; Slectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wavewave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe $85 plus shipping

Kruse Systron Donner RF Oscillator Model 5014-9. 6 - 8 GHz Working Unit. Features include: RF Attenuator Control; Slectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wavewave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe. $85 plus shipping

Kruse Systron Donner RF Oscillator Model 5015-2. 7 - 11 GHz Working Unit. Features include: RF Attenuator Control; Slectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wavewave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe. $85 plus shipping

Total of 1 each of the plug-ins

Pictures available for all above by e-mail

George... I had one for many years, and sold it about 5-6 years ago.
It uses a pair of 4CX250B's, originally supplied with 7034's. (4x150's)
You don't want it!
It will sell for well over a grand because of collector appeal only.
Johnson made very few of them, so they are sought after.
It weighs about a hundred pounds, and will get you about 500 watts on 6 meters, and
with the blower fan, will make a lot of noise while doing so.
I replaced mine with a converted Heathkit SB230, and I get more output with less fuss (six meters)
Oh, I forgot... You also need a very expensive dow key relay for the Tbolt because you have to
switch the rig and antenna to bypass the amp or not....This is built in to most newer amps.
And, even if it works great, you have to replace or be forever mindful of the old ('50s) components.
Filter caps etc. are ready to fail!
Regards....Dave

Just getting into VHF/UHF. Always worked HF. Curious about the autopatch mod on the back of my rig.
I've seen interconnects for simplex or duplex operation. At first glance, it would appear that duplex is the preferred way to go provided users are capable of dualing. But, simplex gives the operator/owner of repeater-like operation. (Don't quote me.)
Could someone shed some light, operation, option and opinion on these? They're autopatches but have other uses as well, correct? Intended more for the individual base station than a repeater installation, correct? If you live in an area without access to repeaters or autopatches, is it a good idea? What are benefits and drawbacks/restrictions?

>>So, I'm again requesting input from anyone with experience with
these HTs...

The Kenwood TH-F6a is a solid performer on 2 meters, 220, and 440.

I, too, have read a "lukewarm" review - but it came from someone who
never had one in his hand before to test (there were so many errors
and blatant misrepresentations that it was obvious the guy never
touched one in his life).

I've had mine for a week now - having a great time with it. The
standard antenna is fine - My first session with the unit, I easily
programmed freqs and was hitting repeaters with ease.

The software is available free on the Kenwood site. The cable is about
$30. The software will undoubtedly be improved as time passes...the
version from kenwood is labelled, "Beta v0.0."

Source record: 53168

I know it's not *supposed* to work...(grin)...but I am having excellent performance from a Pryme RD-98SMA on my Kenwood TH-F6a HT.

The Pryme RD-98SMA is their super-thin, 17" dualband HT antenna. It is rated at 2.15 dBi on two meters and 3.2 dBi on 440. But I am receiving excellent signal reports on the 220 band as well.

Sure do. Paid Motorola for it. You can, too! Obtain further
information at...

http://accesssecure.mot.com/Accesspoint/cgi-bin2/SoftCart.exe/Accesspoint/Software/rsmain.htm?L+test+pbcz7345+1003728583

As an alternative, you can probably have your local Motorola delaer
program the unit for you for a reasonable fee.

Hi Group,

While repairing my HP 8640B sig gen. I accidently removed 2 wires from the -5.2 fan board, without noting where they came from. Darn! Anybody have an 8640B that they could take a quick peek under the hood. Top cover, right at the back, little card with yellow card ejector. There are 2 wires, one with yellow stripe, one with blue. Goes to a board with 93 and 96 labels.

Help please and thanks.

I would say it will be an "unreasonable fee" judging by the Motorola dealers I have competed with over the years. Typically $75 per radio, even in large numbers. My shop made good money programming Motorola radios because they charged so much.

From: eusa@compu-ad.net
Message-ID: <599cafbb.0110211914.56bf98a0@posting.google.com>
Source record: 53098

Hello,

I'll admit I'm a bit of a dinosaur- I have never owned a digitally tuned rig. I have always used PTO style rigs because of the smooth tuning. When I recently read that a Ten Tec Jupiter takes 25 turns of it's main tuning knob to tune just 3 Khz at a 1 Hz step, I couldn't believe it!!! The idea of tuning a rig and hearing a "musical scale" of sorts as you tune thru a signal is not very appealing to me at all. Are there ANY modern rigs that offer smooth tuning at a faster rate?? Is a 10 Hz tuning step rate very noticeable?? (It probably is...) I spend a lot of time just tuning around the Amateur and SW bands, so this is important for me. Thanks for any advice!

73, -Jack (Currently a Ten Tec Corsair II and Kenwood R-1000 owner, not considering going digital at the moment!!)

I haven't noticed the digital steps since the first generation of digital radios. The current generation acts and sound like analog, but with selectable rates- even smoother than a PTO setup!

Hi,

Except for the low end of the market type radios this doesn't seem to be a big deal these days. Certainly my IC-775 does not show the problem and neither do several other similar radios.

About the only time you can detect much of anything is when you set things up to step *very* fast. Some radios will let you set up for > 100 KHZ per dial revolution when fast tuning. Needless to say you do get some odd sounds then. As soon as you slow down to a reasonable rate they go away.

This was a problem on older radios and still is on some low cost radios. If the radio runs 1 KHz steps it's going to do some odd things. Of course with 1 KHz steps about the only thing to listen to is AM....

Enjoy!

Sorry you have had that experience ... I would never charge a fellow
amateur radio operator that much to program an HT.

Paul, on both of mine the only connections to the -5.2v regulator and fan board (A18) are through edge connectors; the one on the top going to the fan.
No separate wires.....

Normally hp in their wisdom will label separate wire connections with the color code, for example 93 and 96 would be white wires with an orange and a blue stripe respectively, as per the standard color code

I have for sale a nice Icom IC-730 HF Transceiver. This one has low hours.
It does have a few small scratches on the sides, but overall it looks great
and
it works very well. The transceiver is a 100 watt unit covering 80 through
10 meters including the WARC Bands. It is a SSB, AM, and CW rig and is small
and great for mobile operation. Comes with original Mic and Power Cable.
Price is $295 plus shipping from 79602. Thanks, Charlie Hugg,
K5MBX

Source record: 53109

In your case, depending on the orientation of the attic, etc, I would
look at either a horizontal loop (1/4wave on the side) or maybe crossed
dipoles (turnstile) so you get omni coverage in the Horiz plane..
a dipole will give you DEEP nulls off the ends...and you might miss
something in that direction...The horizontal loop is a good antenna
but you need to match its 100ohms to 50ohm cable....OR use 75 ohms
as the feeder and your rig may like that better...

Attic antennas are always a pain.....If you could mount a THIN wire loop
OUTSIDE, you would do MUCH better....sometimes the shingles on the roof
may have mettalic pieces in them which tend to attenuate signals into the
attic...also the staples or nailes can be a slight issue....BUT if thats
all you can put up, its better than nothing! :)

GM does have an installtion sheet they pass out at Dayton every year
and I believe it is on their web site somewhere...

BTW Motorola and Larsen and others sell SIDEPOST adaptors that replace
the bolts in the cables and then give you a BRASS stud and nut to connect
cables to so you get direct connection to the battery! (make sure you fuse
the neg as well as the pos if you do this...an open ENGINE ground means the
starter will try to draw through the RADIO gnd lead...can cause some
minor smoke! :)
The adaptors are $10 or so each...I use them all the time in my installs..
any 2way shop should have them or Larsen has them in their catalog..

In the undisclosed town where I ran a Kenwood dealership, the local MSS was it's own worst enemy. Their attitude was better than a large advertising budget on our part. Even new Moto radios bought from them had a $75 programming fee tagged on for EVERY one. They didn't even like to talk to hams about radios, unless you knew the owner who was a ham and were in his "clique".

We programmed all our radio sales for free, and made reasonable changes for free during the life of the radio. For a competitor's sold radios we would charge a few bucks at most, and for a large quantity we did it for the current bench rate. For Ham's that were not pests it was usually free, provided we had time. They might have to wait because customers took priority. However, there were a few hams that wanted reprogramming every couple of days, and didn't care if you were busy- they paid the same rates as the customers. They really should have bought ham radios that were self programmable...

Ok folks I am running out of steam trying to get this thing to work. First and foremost ths is a model with the serial number of 04 for the production number. Second, I have already done the solder mod and done the reset. However after reading some different information I neglected

to do the PTT/MON/Button ON function and was curious if this is what potentially defeated my mod.

Right now it does TX out of 470 but nothing over that. Also, when the "band" comes up I only see A1 and no option for FREE.

Any ideas I am stumped.

PS, I also just bought my cable and software for the ADMS.

ANY HELP!!! PLEASE!!!

Good evening, Mark.

I've had a TH-F6A for a couple of weeks, not long enough to really
test it but long enough to form a few opinions.

Don't bother trying to use it for SWL unless you have an outside
antenna. I have yet to hear anything on the HF bands with the
internal antenna.

As for your other question ... the receiver doesn't seem quite as
sensitive on the VHF and UHF bands as other, narrower-range VHF/UHF
rigs I've used, but it's plenty sensitive enough to hear anyone you
can talk to with 5 watts of power.

All in all, I'm happy with mine so far.

4826. Help me decide on new portable/HT, please

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-22 23:51:22 UTC
From: Mark Spatny <vfxproducer@NOSPAMhotmail.com>
Message-ID: <_h2B7.3252$Sd.295667@newsread1.prod.itd.earthlink.net>
Source record: 53126

I'm going to buy a new HT or portable in the next two weeks or so which I will primarily use for working parades and maybe emergency traffic as I do volunteer work for the Red Cross and other civic groups. However, I'm interested in other features that will make the radio useful for other hobby activities, to make the purchase more worthwhile. I'm interested in a radio that will do at least 2m & 440MHz, and be very portable. Those are the basics.

So now I'm basically trying to decide between the Kenwood TH-F6A, Kenwood TH-D7A, and Yeasu FT-817. All look great on paper for different reasons, and appeal to different interests of mine. So I guess I need to hear how these radios stack up in reality compared to what they advertise to make a decision.

Yaesu FT-817:
Overall, offers the best range/features. All the bands and modes I could possibly want, and the low power doesn't really bother me because my primary needs are for line-of-site communication in my town. The down side is the higher price, and the size of the box which is a bit of a pain for carrying. Also, I'm not sure if it will take as much of a beating as the other radios. But it would be fun to give my 10m HF privileges a try. Right now, I don't have an HF rig.

Kenwood TH-F6A:
The appeal here is the wide HF reception. If it works as well as a portable SW receiver for traveling, that's great. I'm a big fan of SW listening, travel frequently, and would appreciate a radio that can handle both my hobbies reasonably well. I'm not expecting it to be as good as a stand alone communications receiver, or even come close. But if I can get the big broadcasters (BBC, Radio Nederland, etc.) I'll be happy. Also, I'm worried about whether the wide reception range creates reduced performance in the 2m/440 bands.

Kenwood TH-D7A:
It's been a long time since I've run packet, but this appeals to me. As I understand it, with the TNC built into the radio, all I should need is the cable from radio to laptop, and software, and I'll have a mobile packet station, right? I don't really care about the GPS functionality, just being able to send packet messages without lugging a separate TNC & power supply is the appeal here. My questions about this HT are:
1) Does it come with packet software for the PC? If not, what's available?
2) Can I input text messages from the radio w/o a PC easily?
3) Has anyone managed to use the APRS functions with a Palm 505 instead of a laptop? I know it has been done with other Palm models, but the 505 has a different connector that may be problematic. I can't find pin-out

information on it.

I realize that these are VERY different radios, and you might not understand how they can all be on my short list. But they all have features that match my interests. So any pros/cons/information you may be able to offer based on personal experience would be GREATLY appreciated.

Hear! Hear!

In addition to being enormous fun to play with, this is one
way to make absolutely sure you get the keyer you want. You
might even come up with something genuinely new and interest-
ing in the process.

If nothing else you would be creating something yourself,
rather than just buying an appliance off the shelf. This
doesn't happen enough nowadays, and is to be encouraged.

Anyone aware of a safe, reliable alternative to an expensive Motorola 4008B RIB? I'm finding lots of inexpensive (some $50) aftermarket RIBs out there that APPEAR well constructed...but is there any particular aftermarket RIB with a good reputation? how about the tiny little RIB at 2wayprogramming.com? i don't want my radios (HT1000, GP300/350, Saber) damaged, and i'm willing to spend the money on a Motorola RIB if i HAVE TO. but maybe there's a particular aftermarket RIB out there basically identical in design, performance, and reliability compared to a Motorola unit...minus the price? maybe?

YOu may want to checkout the free sound card programs at this site.

http://www.muenster.de/%7Ewelp/sb.htm

The MMSSTV is very good for free. I have not tried hf packet so can not recommend any programs for that. There are many other digital programs that will work with just the sound card. You can use vox to key the transmitter in many cases. Also look up the Rascal for the interface if you really want to get fancey.. I don't have the url for that handy.

: I'm looking for the very BEST, highest gain antenna I can find for a
: handheld, for the 2M and 440-MHz bands (if it has 220 MHz as well, so
: much the better, but that's not important).

"BEST"??? *and* "highest gain"?? ... or is "highest gain" how you define "best"? So if someone made a four foot antenna for a handheld that had the highest gain it would be just what you want?? Somehow I think not.

What's "best" for one person may not be "best" for everyone.

4835. Re: Simplex Repeater, how does it work?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-23 03:07:19 UTC
From: Brenda Ann <brandad@kornet.net>
Message-ID: <9r2mu4kli1@hiline.shinbiro.com>
Source record: 53139

I have a couple of the small Radio Shack simplex repeater controllers.. they work by plugging them into the mic and earphone jacks of an HT. When the HT receives an incoming signal, it triggers a digital VOX recorder in the controller, which then records up to 30 seconds of received audio (apparently retaining the LAST 30 seconds of audio if more than 30 are received). When the received audio drops, the VOX closes, which immediately triggers a switching circuit that does two things: 1) switches the controller from the record mode to the playback mode, and 2) places a resistance across the mic input of the HT, simulating the use of the PTT switch in an external microphone. It then begins to play back the recorded audio, into the mic input of the HT, with the transmit keyed...

Hope this helped.

I found it to work very well on rtty and 2MTR fm on even the oldest
slowest computer you could find. On the higher speed modes I had
some difficulty . I would recommend a more modern sound card approach.
If you want to fool around with the BP 2m let me know and I will send
you the one I no longer use to play around with.

A transceiver is set so the receive and tx frequencies are the same. A voice recorder is used to store the incomming signal. When the incomming signal stops, the transmitter is activated and the recording is played back. Not a very good way to do real time voice. That is similar to the way the packet digipeaters work. A store and forward system.

I got mine used, so I don't know what it has in the box, but I don't
think it includes the cable or any software. The manual does include
the pinout, though, so if you have a stereo micro plug and a DB-9
available, you can make the cable easily, and there are control
programs free on the net, one of which includes a basic packet
terminal.

FWIW, those ultra-cheapie digital cameras from Wal-Mart (EasyShot,
about $35-40 last I checked) come with a serial<>miniplug cable that's
the right pinout, just needs the mini<>micro adapter.

>2) Can I input text messages from the radio w/o a PC easily?

Depends on what you're talking about using. If you're referring to
quick setup in the field, it's pretty much plug it in, switch the TNC
on, run your packet app, and go. Beyond that, it depends on your
software.

Not a clue on that one. Personally, I'm thinking about trying to pick
up one of the DeLorme GPS modules and see if there's a direct
connection trick for that so I can minimize the necessary cables and
other junk.

Why the heck doesn't somebody just build a ham rig with a GPS in it?

A full wave horizontal loop is anything BUT omni. It has a pattern almost
identical to a dipole with slightly less gain.

4842. Icom U16 Programming Question or Request for the Operating Manual

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-23 06:35:39 UTC
From: Mike Shirley <usenet@sdso.net>
Message-ID: <sm3attor9utu162v4oheihpat7seb336gn@4ax.com>
Source record: 53145

Hello r.r.a.e,

I just picked-up a U-16 and I don't have the operator manual and
am looking for one. But I actually was wondering if someone
might fill in a few blanks on programming.

I have the programming instructions for getting into programming
mode and can do most everything. But:

Can the radio be put on the new 20khz ham band split? I looks
like it can do 12.5 and 25khz but not 5, 10, or 20 khz. My O4-AT
will let me enter 5, 10, 15, 20, and 25khz. Am I missing
something in the commercial version?

How do the scan and priority work? Adding, deleting, enabling,
and locking out channels has be stymied.

Can you help out or point me in the correct direction?

My thanks in advance,

73,s...Mike, WB6WUI

Hi all.

Just an update to say I hold the latest soundcard software's for PSK, HELL, RTTY, MFSK, SSTV etc for both MS Windows, Linux, and MAC. All on the Software & Circuits Page.
Plus a range of isolation interfaces to use between your rig, and pc soundcard. These are high quality units at a very competetive price. There are also other bits and pieces on the Interface Products Page.

Take a look see :-)

Yes the Ranger is an all mode 6meter But the bad news is if you want to
work 'toned' repeaters you have to add your own tone encoder.
The RCI company doesn't seem to see the need to include them at the factory.

BTW I sent an email to them asking questions about the new radio and
'others' they may have. They are going to make a 20 meter and a 40
meter version of the 2950, but no 2 meter version. :(

4848. Shortwave rcvrs estate

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-23 16:49:28 UTC
From: gspubl@tca.net
Message-ID: <3bd59f7b.2167290949@news.tamu.edu>
Source record: 53052

FS: The following shortwave radios are from an estate and are being sold as one lot as-is. None of the radios are checked for operation but all include manuals. The front panels on all radios look very nice and original. All radios are of the rackmount style. So far I have no pictures available but if I can borrow a digital camera I'll take pictures. The radios are as follows:

1. Debeg R-2000

2. Racal 6217E

3. ITT-MacKay 3020A

4. BC-342 military receiver

The price for the whole lot with manuals is $1150, u-pay-shipping, I box.

: >
: > Clint Bradford, K6LCS

Ok Clint; you don't have to charge anyone for any professional service like boat/RV repair, Waiter, Electrical, Plumbing or even to build them a house in the country if you are
either independantly wealthy, have a filthy rich parent or are heavily subsidised party elite or movie star (or perhaps your time is over-valued?).

As a Brother Ham, I was wondering if you had a spare mansion in Beverly Hills and a pension for me to retire to? (I noticed Bill C. went to New York instead)

Pardon the belch;

<soapbox>

All that seems to be changing for economic and security reasons, etc. Now they just get rid of the technicians and substitute installers, and ship the radios away to a depot where they perform a wholesale flat-rate repair. This way, security is maintained while employing wetback, kid, prisoner or volunteer for manual or less skilled technical operations like mobile installations and "picking frequencies", or even a god person such as a federal agent or police officer who may have any of the above executed for touching one of "his" radios.

One side-effect of this, is that when a sophisticated system goes down, the search is on for a competent repairman, as many have disappeared since the system was first put on line. Someone may in fact have to be flown out while the clock is ticking. Of course the ultimate answer to all this would be a complete phase-out of privately owned systems completely, and complete takeover by carrier owned systems with leased portable units such as Nextel or a few of the cellular carriers.

This almost does away with the slave labor, because the portable unit doesn't require installation, and can be easily shipped to depot level for programming and repairs.

All this cuts the overhead and "problem" of having to hire someone just to program radios, change fuses and replace antennas (and occasionally to fix a repeater, dispatch console or link) who may need to be shot in the head as a security "concern" by virtue of excessive experience.

> Yes, but as far as I know, no one makes a 4-foot antenna for an HT so
> what's your point?

Believe it or not, there's a new portable antenna out there that IS a portable antenna that's about 3 feet in length (37 inches) and is designed for use with the FT-817. Not an HT, but it certainely could be used with one.

Hello, titanium BNC connectors? :)

If you want to see the info page on it, go to http://www.universal-radio.com/catalog/hamantht/1659.html

But seriously, if you're looking for a replacement HT antenna, it depends on what you want. If you want to go for all-out gain, go for a long, stiff telescoping rod antenna. Of course, the downside with these are that they tend to break easier. If you want something that's more portable, try a flexible whip...there's usually about 15 inches in length or so.

But if you want a suggestion, try the Diamond RH77CA or Comet SMA-24. I've used both, and recommend either of them for someone looking for a higher-gain, but still manageable HT antenna.

Hope this helps.

73s,

Jim

>Anyone know the difference between the Icom IC-730 and IC-735?
>
>Thanks...

The 730 came out about 4 years before the 735 did. The 730 has no 160 mtr coverage (altho' it does do warc bands), and no FM mode. The 730 accepts optional filters for both ssb and cw; the 735 just takes optional filters for cw. The 730 is semi break-in on cw, the 735 full break-in. The 730 has two vfo's built in, but I'm not sure that it has memories like the 735 does.

4855. FT-817 plus Amp = Base Stattion?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-23 20:53:24 UTC
From: vtail@hotmail.com
Message-ID: <3bd5d646.284416843@news.netis.com>
Source record: 53071

I'm looking to buy a Yaesu FT-817 for portable work, and an amplifier to give me 100 watts or so for a base station.

Is the FT-817's performance, particularly in the receiver section, good enough to make it a viable option for my only HF radio?

Does anyone make an HF amplifier that takes 5 watts in and produces 100+ watts out? The only amps I see in the HRO catalog take much more power than that for input and produce 500+ watts output ... and cost from $1000 to $6000.

The only possibility I see in the HRO catalog might be the Ameritron AL-811 at $630. It's 600 watts output for who-knows-what input (the catalog doesn't say). My fuzzy recollection of 811A characteristics leads me to believe that maybe 50 watts might drive it to 500-600 watts output. But does that mean that 5 watts will drive it to 50-60 watts output? It's been 20+ years since the last time I looked into these types of amplifiers but my vague recollection is that input vs output isn't linearr with class AB1.

Any suggestions ... or experiences with the FT-817 as one's only HF radio (base/mobile/portable) would be much appreciated.

John,

When you were working the DX on CB (I hope it was legal from whatever country you were operating in) I bet it was during a sunspot maximum.

When the sunspots are cooking I have worked practically everywhere with 100 watts and a trap vertical.

No amplifier will compensate for poor conditions, but an amp CAN help out in marginal conditions. If you hunt a lot of DX you will run up against marginal conditions quite frequently. From my experience you get a little bit of an edge in these circumstances, but not much more. To a lot of serious DX'ers, the little bit of edge makes a difference and is worth it.

It's not really a question of propagation, it's a question of "band-width".
With the crowded band conditions these days, it has become more and more
nessary to use an amp to complete the desired communications.
Too many hams crowding into a finite band space, with loud-mouthed DXers &
Contesters stomping on any on-going QSO's, creating an even greater need for
power to maintain a QSO.
I will use 100 watts most of the time, but if my QSO gets interupted by
"near-by" interferance, I can and will go to 1500 watts.

Can't do it that way, the 102 does not use xtal oscilators like it's older brothers.

The FT-102 has a PLL that generates the local signal. You would need to find out how to "enable" the PLL on the band you want.

Even though my amp is small by comparison to the 1.5KW Amps
The 170 Watt Amp i use for 2 Mtr SSB allows me to have a little
more power out (About 140W) AND IS A LOT CHEAPER THAN A $2000
VHF Allmode Radio and when the band is up things get intresting
real fast

If your going to chase grid squares you'll need the power
for local ragchewing...10 Watt is plenty

Have a nice one all

Rick,

Yes, the RX of the set can compete with many base sets. You need a small amp that can be driven with the 5 Watts. Please check the link below. You can get price information directly from the factory. With 50 Watt RF output and a good antenna you can talk around the globe. The difference between 50 Watt and 500 Watt is only 10 dB, 1 s-point on the receiving-scale of your QSO partner. Even with 5 Watts and a good antenna you will be able to work longdistance. It's just easier with more power on the crowded HAM bands.

Is there a different crowd that inhabits Ebay? Your lucky if you get 50%
of what your asking for an item here or on other swaps. You put it on
Ebay and you get more than you paid for it??? No wonder people are
migrating to the dreaded Ebay!

Amazing isnt it?
I'm looking for a used, decent shape dual band (2/440) mobile. I've seen ones go on ebay for close to or above what a new one would go for. However, I can say...if you watch closely, you can find deals. I know I have.

Hi,

Under the best of conditions you can go a *long* way with 5 watts or less. Unfortunately the best of conditions don't happen all the time, or even most of the time.

Amazingly enough a radio path may not work the same way in both directions. It may take you a *lot* more power to get a reasonable signal in to the other guy than it takes for him to get a signal to you. You are always fighting the local signal to noise (or signal to QRM) ratio at the receiving end.

If you are trying to do any sort of communications in a predictable fashion you are not going to depend on the conditions being just right. Net operation on an HF net is one example of this. Any kind of scheduled communications are another example. This is what drove most of the military stuff to higher power back before they moved over to satellites.

DX is another whole subject. If you are trying for specific awards to specific areas it will take a *very* long time to do if you wait for perfect conditions. If the island you are after is on for the next 10 days and then they go home again, you may or may not have good (or any) propagation to that area during that time period. If the next expedition goes out there in 10 years that's kind of a long wait.

A full gallon will pick up your signal by a bit over 10 db. By the time you get a linear you probably are running a beam as well. Depending on make and model the beam *may* add another 5 to 8 db over a vertical. The net result is that you will be at least 15 db and maybe as much as 20 db ahead of the stock rig / vertical. A 20 db increase will take you from buried in the noise to very readable. It will also make you stand out in a pileup.

If you never take a shot at a bad path you may never need the boost. Of course without it you will never know what could have been. You never know if the band has dropped by 20 db or by 60 db unless you take a shot at it. Admittedly most of the time a dead band is dead, but not all the time.

I don't run a whole lot of power these days but at one time I did. I would guess that about 95+% of the time I ran barefoot and had no complaints about the result. The other 5% of the time the amp did make a difference and was well worth having around. It's certainly not one of the first 10 items I would put on a shopping list, but it's in the top 20 for an HF station.

Don't know if that helps or not ....

Enjoy!

Here in Western Europe the maximum power that is allowed is 400 Watt. And we work all around the globe. One of the reasons why one needs more PEP is because there are so many others who all together raise the noise level on the HAM-bands. You need your extra PEP to shout louder than the others. Bursting through pile-ups is in a way to be compared to showing your muscles and kicking other people from the line in order to be the first to be served. If one really wants 100 % chance that one will get a clear connection and be served immediately, use the telephone or Internet. Isn't it the fun of it all that conditions change and sometimes one can make a rare QSO. Sometimes you win, sometimes you loose. With big Amplifiers you can win more often. And sure you can use your PEP to overcome the natural noise level on the frequency. That would be a fair reason for using more power. But keep in mind that your power is part of the noise level for other stations in the world.

Maybe someday there will be a part of the HAM-band reserved for QRP stations. Just like there is space for CW. If there wasn't a reservation done for CW it would have expired already long time ago. I believe that many HAM's can't believe that with 5 or 10 Watts you can make also trans Atlantic QSO's.

Between 5 and 50 Watt's there is only 1 s-point.
And from 50 to 500 Watts there is another s-point.
And from 500 to 5000 Watts (!) there is an other s-point.

So between 5 and 5000 watts there are 3 s-points.

If your signal at the receiving station is more than 3 s-points louder than the noise-level in that particular frequency and you are running 5000 Watts, he would still hear you if you were running only 5 Watts...

Yes, but such amps are no longer legal for sales in the U.S. Thank the CB crowd for that. HF amps sold in the U.S. are required to take a minimum of 50 or 60 watts of input power. You'll have to look at importing something (illegally) to get an amp that works with 5 watts input. Back in the early 70s, Ten-Tec made a 5 watts in, 50 watts out amp for the HF frequencies, but no one has made one since, domestically, as I understand it (except those that cater to the CB crowd, and those amps are a little dirty, signal-wise).

:
It seems to make more difference than that. I run a 30L-1 about 20%
of the time, and it can make good copy out of difficult. Especially on 75
and 40 where the noise can be formidable. That's really the point.
On the higher bands noise is less and when the ionosphere is sufficiently
ionized, there is less need. But it just doesn't make sense to crank up
the power if it is all going into space but it sure can help with marginal
conditions when the band is trying to make good.

I might run the full limit occasionally if my circumstances were more
established, but 600 watts from a table top 115vac unit seems to be a
worthwhile jump from 100 watts and a good bang for the buck.

I also do some barefoot mobile operation, and I find I have to really
pick my battles, but many DX stations go out of their way to pick me
up despite the loud ones.

You can always use some discretion and reduce your mic gain.

Jim, ac6tk

4889. Best SMA Antenna?

Bob,

I read in the Yahoo newsgroup that it is illegal to import into the USA. But once the unit is in the USA it can be used by a licensed HAM. I don't know it is true but I read the mailings in a Newsgroup between North American HAM's. It's a strange rule because as far as I know you are even allowed to build an amplifier yourself for HF.

You can check for more information:

http://groups.yahoo.com/group/FT817

You can also buy one in Japan and have them make an alteration so that it will not work on HF unless you make a
modification at yourself. They could for example lock the bandfilter in the 50 MHz position. They are a flexible company as far as I know and they would

like to do some extra effort to sell to HAM's in the USA. The HL-50B is equipped with VHF transistors instead of cheap HF transistors. Is it also illegal to buy a 50 MHz amplifier?

These are all good ideas. It is important to make note of the
spectral purity and any spurs that may be lurking in the
output of the FT-817 before feeding a broadband amp.
Espescially here in the states. The biggest problem with a

5 watt in 100 watt out amp is that most designs are for illegal CB stations. You might be better off building your own or robbing a PA section and filter networks from a junk radio and making a few mods. If done properly, this is no different from what they put in any base station. Some of the cleanest designs are AB circuits operated well within their linear range with gang switched bandpass input and output filters, or tuneable pi networks. My particular favorite would be a pair of 6146B in AB1 with a pi network output robbed out of a swap meet HW 101 (I have seen them untouched and ignored for $100 or less). It could be enclosed together with the power supply and input filtering and relay action for a neat base station.

There's a lot of funny business that goes on there too. I wouldn't believe everything you see there. Too many stories of people having multiple id's and bidding up their own stuff. I also see many things being relisted since the 'wiining bid' never sends the money. That makes me think there are biiders that have no intention of ever buying it, just bidding it up. I personally haven't seen too many good buys there. Most sellers ream you on packing & shipping too. Just my $.06 worth.

If one POSTS a question in the newsgroups, one should seek
their answer IN the newsgroups.

The QRZ web site is a good source for locating logging
software, also There are quite a few links at
http://www.hamsnet.net/download/log.htm

But since you don't check the newsgroups that often, you'll
probably not even realize that I tried to help...

>
> These are all good ideas. It is important to make note of the
> spectral purity and any spurs that may be lurking in the
> output of the FT-817 before feeding a broadband amp.

Yes, that's a good idea. I read about the unique design of the RF amplifier inside the FT 817.
It's only one well designed amplifier for 1.8 - 440 MHz.

> Espescially here in the states. The biggest problem with a
> 5 watt in 100 watt out amp is that most designs are for illegal
> CB stations.

There are manufacturers who offer wideband amplifiers 3,5-30 MHz without any filtering other than 30 MHz.

An other thing is that manufacturers advertise that their amps can deliver twice as much RF power on SSB than on FM/AM. Of course the PEP power is always twice the effective power such as measured in FM.
And for their convenience they say RF-power FM=RF-power AM. If they would be honest they would divide the max. average by 4 as 3/4 of the power goes into sidebands during modulation and thus the AM carrier is 1/4 of the maximum average power.

Well known HAM radio manufacturers don't make this calculation trick and mention 100 Watt FM = 100 Watt SSB and not 200 Watt PEP and they mention the carrier power of an AM signal.
So in fact the HL50B is only 25 Watts SSB and 25 Watts FM. Tokyo Hy-power mentions 50 Watt PEP on SSB and only 35 Watt PEP
with 5 Watt drive (17.5 Watts on FM).
It's not so bad and it can make a difference when you haven't the ideal antenna condition and most of the precious 5 Watts disappears into wire loss, insufficient SWR or into the ground.

You might be better off building your own or
> robbing a PA section and filter networks from a junk radio
> and making a few mods. If done properly, this is no different
> from what they put in any base station. Some of the cleanest
> designs are AB circuits operated well within their linear range
> with gang switched bandpass input and output filters, or
> tuneable pi networks.

That would be a good idea indeed. I have thought about building an amplifier myself and the right pi-filters for each band.

The HL50B is a Class AB-design with two 2sc1964a transistors and switched band filters

for each HAM band. (2sc1964a is developed for max. RF outputpower of 30 Watts , measured on 175 MHz)

Here is the information that I received from the factory:

HF & 50MHz/50W Linear

HL-50B
(5W Drive Model Available for Y-817)

FEATURES : A compact solid-state linear to boost 10W xceiver to 50W output level.
Ideal for mobile operation in combination with HF/6 meter transceiver.
SPECS. : Freq. Band: 3.5-29.7 MHz and 50MHz (Works outside amateur bands also.)
Mode: SSB,CW, AM,FM RF Drive Power: 10W (1-10W) RF Input(DC):
120W peak max. RF Out : 50W p.e.p. max. (25W for AM, FM), 35W with 5W drive.
Power Tr. : 2SC1946A x 2 Circuitry: Class AB, push-pull Others: Switch selected
low-pass filter for each band. Carrier operated send-receive switch circuit. LED power
output level indicator. External remote controller(HRC-60, optional) terminal.
DC Power : 13.8V, 10A max. Protections : Against high SWR antenna, reverse DC
power polarity. Cooling : Natural air flow.

Dimensions & Weight : 148x55x190 (WxHxD)mm., approx. 1.4kgs.

The 50 mhz and above amps are apparantly legal -- Mirage sells a whole line of amps in the US that take a few watts of input power and pump it up to 50, 100 or more watts. It's the HF amps, for 10 meters and below, where the restrictions lie in requiring 50 or so watts input.

I'm not sure about the rules on importing the Tokyo-type amps; but the fcc has a whole section on amps at their fcc.gov web site. (Written in pretty convoluted language...)

From: Frizz <kg4ivt@hotmail.spamsucks.leaveme.alone.com>
Message-ID: <TuHB7.31662$%B6.12645634@typhoon.southeast.rr.com>
Source record: 52958

I am using a Yaesu FT-290r rig with it's supplied YM-47 microphone. However, today the element in the mic appears to have died. I didn't have any other elements lying around that I could take out of other mics so I decided to use a small electret element that I bought a while ago. Included in the packaging were hookup instructions for this element, a 10k resistor, and a 3.3uF electrolytic capacitor. I followed the instructions connecting the 10k resistor and the capacitor(+ end) to the output of the element and then a ground connection for the ground side of the mic. But when I hooked this element up it started changing frequencies without me pushing the buttons on the top. I disabled one of the buttons and turned the lock on for this feature but that didn't help. Does anyone know if I did this correctly? Is there another way to do this that I missed? Any help is appreciated. Thanks!!!!

Message-ID: <9r7jlo$lu0$1@nntp9.atl.mindspring.net>
Source record: 52962

Ham Radio Electronic Keyer MFJ-406 - Ebay

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1288507846

This MFJ keyer is in "like new" condition. I can't find a mark on it. It works perfectly, and includes the power supply. For those who aren't aware, this keyer can be used to automatically generate the "dots and dashes" that make up morse code (when used with a key designed for this purpose). It also produces an audible sidetone through the built-in speaker.

I will be glad to provide additional information, or send more detailed pictures to your email address. Contact me at w4tq@mindspring.com

Yeah I enjoy making long rare contacts using 10 Watts Pep. Its the
challenge that makes it fun and I like to experiment with homemade
antennas to improve signals etc..

4915. Ham Radio Update

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-25 02:29:51 UTC

John,

Keep checking QRZ.com and eHam.net for these rigs. I've seen several dualbanders on there for half the price of the same rig new (bought a couple, too). Just last week, saw an Alinco DR-610T (new: $450) for sale, asking price $250. I own 2 of these, they are good rigs.

Hello, I have a Uniden ARU251K. I'm curious of the sens. and what is normal.
This one seems a bit deaf to me....
It almost seems like it was meant to be that way... ?? also wondering if
this will do ham?
thanks,
Randy

4922. Looking for mobile set up for PS events

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-25 12:56:04 UTC
From: gdsnkl@bellatlantic.net
Message-ID: <3bd8097b.38061810@news.bellatlantic.net>
Source record: 52975

I'm looking into buying a rig for public service events, beyond an HT.

While I would use it for mobile operations in the car, I would want to be able to carry somewhere, hook it up to a 12V battery pack and portable antenna and go, for both PS events and emergency use.

Some of the specific features I would want would be light weight, efficient power usage, rugged and weather resistant without being mounted in a car, easily programmed in the field, reasonable power output 25W+, at least 2M/400. A reasonable price is relevant, as this unit would be less protected from damage than the usual mobile.

Any thoughts on other features to look for or specific models?
Happy trails,
Gary (net.yogi.bear)

Yeah right! I would like to see you use your 10 watts to contact a station with a G5RV, see how far you get then. You probably wont be heard. Its is easy to say you worked a station with a FT817 and a rubber duck, but the reality is that other station with the huge beam and tower is doing 80% of the job. If QRP is so good why dont we hear QRP station making ragchew SSB contacts with other QRP SSB stations?

Some fail to understand that a communications circuit is a reciprocal one and that it requres a certain signal to noise ratio, and to aquire this requires either good antennas and power. Thinking that there is other "MOJO" like a $5000 dollar radio with DSP using a dipole in the attic with 10 watts you only deluding yourself that you think you can change the laws of physics. While we all want do with the least amount of effort and expenditure, the nature of HF RF communications requires reasonable equipment, if you dont believe ttry your QRP radion 75 meters!

There's plenty of QRP to QRP contacts, too. Last September, from France, I worked Florida 2 way QRP, for example (5 watts and a 16 ft. vertical on 20 meters). Hang out around the QRP frequencies and you'd be surprised what you hear. Jim W5AI

4927. Bird Slug Calibration

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-25 15:36:17 UTC
From: CJ <cjr@visi.com>
Message-ID: <3BD83171.2475876D@visi.com>
Source record: 52981

I know that this has been on here before, but where can I find an adjustment on a 250H, 250W 2-30 MHz slug? I think it should be behind the label but the label looks rather substantial to me. Anyway, the slug consistently reads out about 35W when I it should be more like 100W according to everything else I have here. Is there any hope here?

73, CJ K0CJ

I have NEW slugs that will work in either the BIRD or COAXIAL DYNAMICS watt meters-following are for 2-30 MHz (contact me for other wattages and frequency ranges)

5KW-$150
10KW-$160
25KW-$170

Also have NEW meters made by Coaxial Dynamics which will read both PEP and "Bird Watt" - at the flick of a switch....These meters have a larger size meter than the Bird models-Made in USA -2 year warranty

These are EXCELLENT meters - $390

Please Email all serious inquiries

Thank You

4929. Computer interface cable for ICOM 756PRO

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-25 17:05:04 UTC
From: silber@rcn.com
Message-ID: <26366329.0110250905.1327856c@posting.google.com>

I want to do computer loggine with my 756PRO. I'm wondering if there is an interface cable I can get to do this. I know ICOM has the CT-17 but thats $130 or so.

Haven't seen anything out there yet and thought maybe someone here knows the answer.

The software I'm considering is DXBase 2002.

Thanks,

Steve Silberman

Steve,

You need an RS232/TTL convertor (like the CT17) to do the job as the voltage levels at the Icom aren't compatible with the computer's serial port. There's quite a few simple designs around to roll your own - most based on the MAX232 series chips. You'll still need cables to go from the rig to the PC via the convertor but they are simple two and three wire cables. Drop me a line if you want more info.

Regards,
--

Steve,

If you're looking for cheap and (relatively) easy, but more robust, you
might consider the interface described below... about $10, all parts
available from Radio Shack, and uses one IC. I built it and it works great.

"
The Icom CT-17 CI-V level converter is pretty pricey and requires
external power. I built a cheap and easy cable interface that
requires no external power and works like a champ. Howard KD6UU
I posted the schematic and instructions on eham.net:
http://www.eham.net/articles/1588

Hi Bill,

Call directory assistance for the SF Bay Area, in specific the 415 SF and the 510 Oakland area codes. Ask for both the Oakland and SF phone numbers for Day Wireless (a Motorola MSS). Call them, probably Oakland first and ask if they can look up the number for the manual and order you one. Then ship it to you using your credit card.

If you want to do it direct, get on Motorola's web site and get their parts ID and order phone numbers and do it yourself.

cheers

Bury the bird, if I recall from my days in a calibration lab, the slugs can not be adjusted. You can call Bird, they are usually very good about supporting products.

From: hackertito <hackertito@yahoo.com>
Message-ID: <3BD885ED.5FD8765E@yahoo.com>
Source record: 52992

Hi all. I have a Kenwood TS50(not TS50S), and would like to know the computer-control capabilities of the TS50. On the manual I see that there are a unit IF-10D. What are the features of this unit? Its also possible to connect IF-232C to my TS50?...
I would like to know what would I control with my PC, and where is the software ...

Tnx in advance...

Tito

> and it was cool since I had nothing fancy and got good contacts.

Yep, I thought you would be on a high freq. You can get out with a
lead pencil and 5 watts on 10/11 meters. Lets see him try 160/80/40
meter DX with his 718 late at night. Sure, he may make a few contacts,
but most will be straining their ears to pull him out of the static.
Many won't hear him at all. You run an amp when you want to talk to
people without having to repeat every other sentence. Usually, on the
lower bands. Most bands, 30m up, you don't need too much power.
160/80/40 phone you sure will at times though if you want a decent
signal that doesn't resemble the energy of a gas expulsion from a
large size horsefly. MK

In addition again, the 730 has one memory per band. And it's tunable.
What it works out like, is having 3 vfo's. "The 2 VFO's plus the
tunable memory channel.
The only plus to the 730 being ham band only is it's a pretty clean
quad conversion receiver. One of the few quad conversion mobiles out
there. I've got a 730 here. But I'd likely trade it for a 735 pretty
fast. The 735 is quite a bit more useful with it's gen coverage and
FM. etc. As far as actually using them on the air, I prefer the 730
though when comparing the two which I've done. I like the readout and
tuning speeds etc better on the 730. Both are dang good rigs. I'd
recommend either one to anyone. The 730s' go cheap these days. A lot
of radio for 250-300-350 or whatever. The 735 is bangup for a tad more
cash. MK

That's an awful lot for a Bird slug to be off. I'm assuming you're not comparing ssb PEP readings, elsewhere, to "continuous power" readings on the Bird? (If you are, try the CW mode, comparing your Bird to your other meters.)

Other than that, I'm not aware of a calibration adjustment, although you can check at the Bird site, http://www.bird-electronic.com/

Has anyone upgraded the CRT display on their R9000 or 781 to the LCD unit available from Icom.

If so how sucessful was the mod and how easy was it to do?

Have you found any drawbacks with the LCD compared with the CRT?

have you found any benefits from having the LCD display?

Regards

Steve G8EBM

Ed ... you can perform a great service to us! The Kenwood PG-4P cable
is seriously backordered from Kenwood. I have been told that Kenwood
doesn't even have anyone making them for them right now.

If you can make this "other" cable workable - and charge us a
reasonable fee for the "adatper" cable - you can be a hero...

> Yeah right! I would like to see you use your 10 watts to contact a
station
> with a G5RV, see how far you get then. You probably wont be heard.

Well I have a 40 meter 5 watt rig and a dipole made from two ham
sticks. With the short dipole only 10 feet off the ground I've made
many contacts between Virginia and Michigan with Q5 both directions.
The station on the other end was running 50 watts to a dipole. 10
watts and a G5RV would be a killer station! Heck, the difference
between 10 watts and 100 watts on only 10 dB so if you're running
10/S9 with 100 watts you'll still be an S9 with 10 watts.

I'll tell you now, it can't be done, at least not very easy.
The best way would be to use the CRT "monitor" output, to run on a flat screen LCD monitor.

Source record: 53005

I've compared the VX-5R with the FT50. The smaller speaker on the VX-5 results in a noticeably tinnier sound. The FT50 is fuller and more pleasing. I decided not to upgrade to the VX5 for that reason.

I know that doesn't *directly* relate to your comparison but it's a data point. Maybe if you could find the sizes of the speakers and compare them it would give you a basis of comparison.

Well we can all make contacts under short skip conditions, which are high angle and very strong. I am not denying that you can make contacts. Essentially what i am saying is that for reliability on a long distance path QRP is not up to the job. You might be willing to knock off 6 or 10 db, but this can make or break a contact under heavy QRM. On paths like the long path to Europe qrp is just not upto the mark with simple antennas. Heck i operate QRP too with my Elecraft, but cant hold my regular skeds with 10 watts. We all can make domestic shart haul contacts anyday.

To expand on the we could simplify it to a EME path, we all know there is a required ERP to complete the circuit, we know this requires antenna gain and power. Yet we have so many stations using simple antennas and low power making these contacts. The main determining factor is the ability of the other station receiving well. Without one station with good antennas the other station does not exist, to me HF QRP is no different. Like i said try a long path contact with 2 dipoles and QRP and see how successfull you are, yeah i can do it on CW which has a 20db advantage over SSB. You might be luck once or twice but you could not have a basic conversation. Well we all know its a hobby and anything will do and we will give anything a go, but this oversimplifying things can go too far. I cant even think of any one call that sticks in my mind that is a legend in QRP operation that impresses me, i sure can rattle of 100's of stations with exceptional signals.

Anyway the guy who suggests this argument is TROLLing, maybe he can lay out some good technical reasons why QRP is so reliable and why simple antennas are so effectice for him. Maybe he lives on cliff overlooking the sea. I need my 70ft tower and my kilowatt, likwise i hardly hear QRP station in the 75 meter DX window, mmmmm i wonder why? Maybe signal to noise ratio does not exist for QRP stations, its only us poor suckers who listen to these signals who worhsip this god.

Each to their own,

Willy

First you said: "Yeah right! I would like to see you use your 10 watts to contact a station with a G5RV, see how far you get then. You probably wont be heard."

Sorry, it sounded to me like you were saying it is impossible to make any contacts with 10 watts and a G5RV. Certainly a big beam and a KW will get thru under tough conditions when a few watts and a simple antenna won't. If we could run 100 KW that would likely get thru sometimes when a KW wouldn't.

Source record: 53022

: An other thing is that manufacturers advertise that their amps can deliver
: twice as much RF power on SSB than on FM/AM. Of course the PEP power is
: always twice the effective power such as measured in FM.
: And for their convenience they say RF-power FM=RF-power AM. If they would be
: honest they would divide the max. average by 4 as 3/4 of the power goes into
: sidebands during modulation and thus the AM carrier is 1/4 of the maximum
: average power.

That's for sure. When I was in high school, I picked up a quick job as an assembler for $2.55/hr. for the summer. They started me
out in a shed with a bunch of women pasting labels on the front panel of a heatsink alongside some injection molding machines in an
ambient temp of 130*F (had to keep the machines comfortable.

As soon as they found out I had a Ham license, they "promoted" me to Engineering/QC Tech at $2.65 an
hour and moved me into the air conditioned area where
it was my duty to key up a Cobra CB into these "amateur
bi-linears" to make sure they put out at least 100 watts ave.
I soon found out that part of my duties were to assist with
design of filters for the unit as FCC spectral purity
legislation was pending in an effort to put the whole idea
out of business. In testing, the plain unit was on the raw
edge of class B with 4 watts drive and no modulation.
When modulated, the unit would go right into clipping
and the bird would dip to 75 watts ave.

After a few trials with some neat surface mnt band switched
LP filters with a neat series trap at the 2nd harmonic, we
found that no matter what we did, the series cap in the
trap would glow for a few seconds and torch right off
the board! "Gee I wonder why?" I did some tests with a
spectrum analyzer it seemed that the 2nd harmonic from
the unfiltered unit was only about -15 dB from the
unmodulated carrier and 4th was down only 20 dB!
I began to envision a filter twice the size of the original
unit.

My first job had been an interesting experiment, but I
was having trouble as it was keeping gas in the 69
Impala at $2.65/hr so I quit to go back to school in
a hale of threats and bad humor from the Boss.

If you can't afford the job, don't do the interview?

Jim, ac6tk

If it is actually the slug then there is a trimmer pot behind the
lable. The lable is really some very heavy foil that is glued on. I
think the adjustment is near the center of the lable.

There is nothing special about the slug. Just a coupling coil, diode
and pot. Maybe a capacitor. It is just the combination of components
that make it complicated.

Good morning, John.

It's probably "normal in a radio of this size" for receivers that try
to receive from DC to daylight.

My TH-F6A has only fair-to-poor intermod rejection, it seems. I drive
through the middle of town (Nashua, NH) during most workdays, and get
some of what sounds like intermod just about every time I drive
through. Yesterday I brought my old Kenwood TH-21AT 2M HT to listen
on for a comparison, and didn't get any intermod at all on the older
Kenwood.

I only get the intermod when I'm on the mag mount antenna on the roof
of the van. If I switch over to the TH-F6A's rubber antenna, the
intermod goes away. But, if I could find out where the intermod is
coming from, and if I got close enough to that source with the rubber
antenna, there's little doubt that the intermod would come back.

4961. Dirty antenna tuner roller inductor, best way to clean?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-26 06:10:08 UTC
From: vtail@hotmail.com
Message-ID: <3bd8fded.491206998@news.netis.com>
Source record: 53020

I have a relatively old antenna tuner, with a roller inductor, that
has been sitting on the shelf for many years, not being used.

The roller inductor seems to have some tarnish and corrosion on it
that makes for intermittent connections when adjusting the inductor.

What is the best and safest way to clean the inductor and the roller?

Thanks...

Rick WA1RKT

Frankly, I have a bit of a peeve with these QRPers! I'll make contact with someone on 15 CW where I'm straining and getting a vicious headache trying to pick his fading code out of the noise. I give him a signal report RST339. At first I'm pretty happy about making a difficult weak signal contact... only to get a 599 report back and find out he's running something like 1.3 watts!!! So now I'm expected to carry on a QSO that seems more like I'm failing a hearing exam because his signal is dropping every other character into the noise and HE gets to back off his audio gain because the AGC doesn't work so good on his crappy little radio! And just to add insult to injury... HE'S the one who has accomplished something by making a contact with 1.3 watts!! Not hardly! If anyone has accomplished some great feat it's the fellow on the RECEIVING end who manages to copy this anemic radio.

I feel a lot better now that I got that off my chest.

One complaint I have about the TH-F6 is the selectivity. I get a large amount of signal from adjacent channels (10kHz separation). But this is my first HT, so perhaps this is normal in a radio of this size??

The original poster of the question was comparing 100 Watts to 1500 Watts.
Nobody is saying that QRP is always better than 1.5 kW. The issue is that
often big
power is used when the contact could also have been made with a 100 Watts
bare foot rig and maybe even with QRP power.

I've found in a collection of tubes two Varian Klystrons. One is model VRJ 7203A and the other is VRX7204A.

Any idea of what these are? They appear to be new, but I haven't examined them closely.

4968. Which to buy: Icom 2800H or Kenwood TM-V7A?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-26 14:06:52 UTC
From: tony.reo@lighting.ge.com
Message-ID: <438d5d87.0110260606.200a5f3b@posting.google.com>
Source record: 53021

I am real close to buying a dual band mobile.
I have heard some bad things about the Kenwood V7A regarding display problems.
The display developes lines running through it and is expensive to repair.
Is this still a problem or has Kenwood corrected it?
I need a remote head, which they both have, but if you add the cost of the remote head cable to the Kenwood it costs only about $50.00 less than the Icom 2800. Since the Icom comes with a remote cable I think the Icom is a better deal. Any comments on the Icom regarding reliability, or anything else?

Thanks

Tony

Hi everyone,
I also buy and sell on E-Bay as well as here. When I buy on E-bay, I look for the item here, QRZ, QTH and others. By doing this, I get an idea what the true value of the item is. I can then determine if the item is a good buy or not. When I sell, I also use the newsgroups and others to determine a fair reserve price. If I can sell it here for $250, then I set my reserve just under that. Why let it go for less if I can probably get that price here. I have so far not had any problems with bids or bidders on E-Bay, but I'm sure I probably will sometime.
The other thing that I look at is that the price of any equipment is going to very by the region you are in. I see a lot of radios on the east coast and in California, but very rarely do I see them for sale in Minnesota or Iowa. The ones at hamfests seem quite high to me, so I might jump on a radio at a price others seem to believe is high price. It is lower that my local prices, so I am saving money. It might not be as low as some people think it should be, but that is my business. I'm happy, the seller is happy, that is all that counts.
The last note about this is that I would never buy any item by sending some one the money without seeing the item unless I can afford to lose that amount of money. In other words, I wouldn't send anyone $2000 for a FT-1000 radio unless I could drive and pick it up. I have bought other radio equipment here and have never been burned yet. Dan

I've had both- a VX-5 that lasted a week in a snowbank, it's replacement (CAN'T be without a radio!) and then the TH-F6.

The TH-F6 beats the VX-5 in 440 intermod hands down, at least on the 443.3625 repeater on which I converse in the morning ride to work. I've not even had to consider the included attenuator. There is a bridge in Cleveland (Valley View on 480) which renders the VX unusable at that frequency, the TH doesn't even hiccough.

Other functions seem quite similar. I can't tell the temperature of the radio case with the TH, and I can't tell what the pressure altitude is, but then again, I can recieve two signals at the same time, and the included ferrite antenna allows me to listen to 9.5-10 MHz broadcast at night. The TH reminds me very much of the VX in shape and size.

SSB works, though image rejection is very poor- on can easily hear the rejected signal on the other side, the LSB/USB markings are almost then cosmetic (O.K., O.K., there is a slight difference)

Oddities- The broadcast station at 7.335 comes in fine as long as I'm listening to a particular repeater AND the squelch is open. Otherwise the signal is much weaker (if the primary band is off, for instance, or the squelch is closed). I'd believe some change in impedance somewhere, but it isn't critical.

Buttons are harder to press, or rather I have a slightly harder time pusing the buttons on the TH with my huge fingers.

The stock case for the TH (for $16.00, AES Cleveland) is padded and therefore bulkier than the thinner VX's case. It feels like it might offer more protection for the bulkier TH in case of a fall, though it also then makes the radio feel like it is wrapped in a diaper.

The manual for the TH seems much easier to read, and is more complete with some "Frequently Used Frequencies" tables in the back (middle, actually- Spanish is "ao outro lado, ou outro meio" *sorry 'tis Portuguese, but the espanhol reader should be able to figger it...)

for TV audio channels, as well as marine channels. Nothing grand, but a nice touch.

Both are decent tools, the TH is a much better fit to me and the way I communicate.

Had my first 1+1/4 meter communications since the FT-23 went belly up (years ago!) and THAT was a nice touch. In Cleveland, there are only a couple 6 meter repeaters and (it seems) fewer users. I still have the ICOM T8-A if I need to go there (until I sell it, anyway) so I'm not missing anything by not having the VX. There are more 220 machines.

Rick.......I use an old "ink eraser" from the stationery story. They'll take off that old corrosion. Takes a bit of elbow grease, but dosent leave much in the way of chemical deposits that'll get in the way of good contact.

If it is actually the slug then there is a trimmer pot behind the
: lable. The lable is really some very heavy foil that is glued on.
I think the adjustment is near the center of the lable.
:
: There is nothing special about the slug. Just a coupling coil, diode
: and pot. Maybe a capacitor. It is just the combination of components
: that make it complicated.
:
:
: CJ wrote:

I thought the adjustment (if there is one under the Teflon cover)
was for compensation for the inductance of the sampling line.
You might prefer to send it back for calibration or repair. The
problem is usually a bad diode or the slug was dropped and
the sampling line is bent.

Really? I don't believe that disagreeing with somebody on details is the
same as creating enemies. How would democracies survive?
I guess you are right women discuss in a different way than men and don't
bring their point as hard as men usually do.

Are there any women out there to join this discussion?

I consider the IC-2800 as useless just because it does not do dual in band receive e.g. VHF/VHF or UHF/UHF, this was a step backward for Icom, only the cheapo's lack this feature. Their IC-2710 was much better and had decent intermod protection with the attenuator. It was feature rich with great audio. Scan rate was 8 ch./sec. kinda slow but not as bad as Kenwood at 4/sec. All Kens are unuseable to me since they are intermod sponges. There is a fix but you lose the weak stations. And disasterously slow scan rate. Yaesu FT-8100 has really decent intermod protect in the IF stage. Scans at 26 ch/sec. Some older ones had kinda tinny audio but there is a fix. The 7100 has direct entry but no crossband repeat,which all the others do have. For me, the top 2 are the FT-8100 and IC-2710

>
>So between 5 and 5000 watts there are 3 s-points.

This is not correct. I believe it is generally accepted that
One S unit = 6dB.

The difference between 5 watts and 50 watts is 10dB.
The difference between 50W and 500W is also another 10dB while
the difference between 500W and 5000W is a further 10dB !
Therefore there is a increase of 30dB when you move up from 5 watts
to 5000 watts....i.e. FIVE S units, not three.

Of course the same rule of thumb would apply to other scenarios ... eg

10 watts -> 100 watts -> 1000 watts (much more usual situation)

In practice I find people report at least a two S unit increase on
20 metres when I increase my output power from 100 watts to 400 watts.
This shows that most people's S meters are not calibrated properly!!
There should be a 6dB increase on their meters ... i.e one S unit.
Receivers vary from manufacturer to manufacturer and the value of 1 S
unit varies as result! In other words, S meters are really useless as
a method of making definitive measurements, unless you know what each
division on the meter represents in terms of dB

(p.s I have ignored the decimal fractions of a dB for the purpose of
this argument)

Kennedy Associates, 2618 Rigsby, San Antonio, TX is dispersing a 50 year collection of Tex Kennedy, W5QDB, today through Sunday. Not many cathedrals, but tons of tubes and test equipment. Military and commercial surplus. Used two-way antennas. Three large buildings full, mostly of two-way gear and antennas and coax. Worth a look if you are nearby and just want to see how much junque one person can collect in 50 years. Answer: Over 12 acre feet (2 acres 6 feet deep). Bring a flashlight. The Millen GDO low frequency coils are gone. I got 'em!

Depending on the metal, and how easy it is to work with the part, there's a metal cleaner called NOXON that you can buy in most any super market. It comes in a green squeeze bottle. It's mostly ammonia and a lightly abrasive paste. Ideally, you would squeeze some onto a wet paper towel or rag, and apply the stuff to the inductor. Let it sit a few minutes and wipe it off with another wet rag. Repeat if necessary until everything gets cleaned.

This stuff is great on old brass doorknobs and the bottom of copper pots and pans. Read the directions and cautions to make sure it won't destroy the metal on the inductor or roller.

I've also cleaned things successfully by dissolving the stuff in a bowl of hot water, and immersing the parts, leaving them there until the water gets cool. Wipe to get the last bits of stuff off, then rinse thoroughly.

I've cleaned some Hammond Organ keyboard contact rods this way. They started out gray, then turned a very nice golden-yellow after being cleaned just once. Got rid of all the intermittent key contacts in no time.

Hope it works for you.

No problem working DX that is in the contest even though you may not be contesting yourself. You will need to give the correct info during the brief contact which for this weekend's CQ Worldwide SSB HF contest is a signal report and your CQ zone number....

Since you will not be contesting (and submitting your scores) there is no requirement that you log any of the contacts you make....good luck and I hope you snag some " new ones "

You might want to look at the DX tips I have posted on The DX Page of the website listed below...they can be beneficial...

Sorry, but I just don't have time to manufacture such a thing currently, even in small numbers. In fact I probably won't get around to building my adapter for a month or three. However, you can probably find the info you want directly on the internet to build your own. If you have the TH-F6 Ht then you can find pinout for the program cable end in your manual.
I did an internet search for my mobile program cable in Google for the "Kenwood PG-4S schematic" and came up with a lot of good hits. The very first one I went to showed me how to build my own cable... Go to:

http://www.fiberpipe.net/~tateb/pg4s.html

and see for yourself. You can build the whole thing and not need an adapter cable. All pinout data was listed at this site. What we're going to need to get is the two mini plugs that go in to the TH-F6 HT and the complete specs for those are listed in the manual, too. Good luck.

Ed

Its amazing what you can find on the internet if you search for it!

THE TH-F6A PROGRAMMING CABLE DIAGRAM IN THE MANUAL DOES NOT TELL YOU
HOW TO MAKE A CABLE. It tells you how TX and RX are wired to the
computer. The acutal programming cable has a chip in it.
My guess is that the chip is some flavor of the Maxim MAX232
level converter.

Yes, you need to match up the TxD, RxD, Gnd,etc. lines with each
schematic. The URL I posted previously had the schematic of a home built
circuit. Not a MAX232, just a couple transistors is all that's needed.

You can get some good buys on eBay if you're patient, I just bought a lowband X9000 (drawer only) a couple of days ago for about $250. I've seen them onthe NG here recently for $500-600. I don't think a head and control cable are worth that extra $300!

4996. Re: BIG Linears on ham why?Smeters

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-27 02:52:42 UTC
From: willy <willyacht@yahoo.com>
Message-ID: <ZfpC7.4890$c5.54644@newsfeeds.bigpond.com>
Source record: 52900

All good points, now if we can get the manufacturers to build in a A/D converter with a stored calibrated table we would all see how little difference power makes. Its amazing that we have DSP radios with huges computational power yet something as simple as reading a voltage seems to be so hard. The commercial standard for S meters these is days DBuV, a 0 to 130 dbuv scale gives us 3 db steps. When you use a receiver like this you will find that there very few Ham signals in the world that are 20 db over S nine. Those comical signal reports that you hear east cost stations giving 60 over nine reports to Europeans. At most these stations are no more than 10 to 20 db over nine.
My benchmark is to use my 35ft boom log periodic and using my commercial receiver measure the signal strengths of 300kw shortwave stations with 20db gain arrays on nearby frequencie like 15mhz. I hardly encounter stations that could peg or register 300MV's in my receivers. The equivalent of 0dbm. Considering that 60 db over S9 is just a few db below this we see how ridiculous ham radio S meters are. We dont accept car speedometers reading with a error of 60% nor would we buy a multimeter with more that 10% accuracy yet we seem to want to judge how others antennas are working and make assumptions about how much power others are running, including the effectiveness of low power. We do this with equipment that is suitable for a cave man.

How does this relate to QRP well when you use a calibrated S meter you will see how what inefective QRP is, because most people are giving inaccurate reports, my measured S meter reading of mobile and QRP stations put them in the S1 or S2 category yet i hear stations giving S5 and S6 reports, not surprising with all ham radios since the calibration on the low end stinks, most are reading as low as 1db per S unit.

We are really a unscientific bunch, considering we supposed to be the great communicators of the world, exploring science and propagation studies and transmission methods. We do ourselves no favours having poor equipment standards. Yet we have people singing the praises of all this new wonderfull equipment that is totally crap by most standards. This equipment cannot even meet the standards that military met in the 80's with obsolete technology. So much for progress.

Willy

The xyl and I enjoy using a mint TS930SAT. Unfortunately it quit in the middle of a QSO the other day. Will not power up. Possibly the power supply? We are looking for a reputable Kenwood repair center/dealer. We have heard horror stories about the center in VA. Any positive comments would be welcome. Thanks Ralph WA2NTK

> Its amazing that we have DSP radios with huges computational power
yet
> something as simple as reading a voltage seems to be so hard.

That's because its not so simple as reading a voltage. In amateur gear the DSP doesn't begin until the last IF stage at the earliest. That leaves lots of analog amplification ahead of the DSP which varies in gain with frequency, ageing, and component tolerances. The receiver would have to have a look up table for each frequency range that is custom calibrated for that particular receiver in a lab. How would the average ham be able to check and recalibrate the receiver at regular intervals? Hardly worth the cost simply to give accurate signal reports.

While increasing power can make a difference under many conditions, the fact is that propagation often makes a much bigger difference in signal strength than any amount of power increase we can legally accomplish as hams. It is quite possible at any given receiver location to have a 5 watt station with a higher signal strength than a KW station if the propagation is right. There is nothing wrong with running a KW when you need it to communicate. There is also nothing wrong with running QRP. If you don't want to work the weak stations then just don't call or answer them. In many cases you won't know if they are QRP or not.

Most Bird 43 elements do have a trimmer. On most labels it is under the centre
of the box with the power/range rating in it (e.g. 50D).

The glue that holds the label is very strong. It is possible to drill a small
hole in the right place to access the trimmer.

The trimmer just sets overall sensitivity. Either use it to set the calibration
accurately at a wanted frequency, or to adjust overall accuracy over the whole
frequency range. Many elements are discarded because they can not be adjusted to
meet the specified accuracy over their whole rated frequency range.

I have for sale an absolutely mint Kenwood TS-850SAT. I am the original non smoking owner. I have both shipping boxes, hand mic, owners manuals and unopened accessory bag. The radio is a 10 out of a 10 functionally and cosmetically. The radio includes the SO-2 TCXO unit which is a $180.00 option. This is one of the last 850's manufactured. The serial number is 80200024. This is most likely one of the finest 850's you will find. I am asking $950.00 shipped ground UPS CONUS.

Larry,

I forgot that maybe the factory filters went through that wire matrix. No longer with Icom and not having the service manual handy I can't rmember the wiring of filters, but did know you needed to change the matrix to install new filters. Scott Malcom is real good on those vintage products. Icom quit providing direct telephone support for those vintage products except for selling a booklet that contains everything we had in the tech support files for about $ 15.00.

I have had a pair in a QRO HF-2500DX for over 4 years, and they are
still running at or very close to full initial output. I seldom run
more than 1200 w pep, but can go to 2+ KW plus into a dummy.

Non-Svetlana branded NOS Russian surplus GU-74B tubes can be purchased
from eastern European sources for around $80 each delivered to the
USA. If you are nervous about sending a money order to Lithuania (you
shouldn't be) there is a domestic source who gets about $100 each.

http://www.fiberpipe.net/~tateb/pg4s.html

The schematic above is a universal type circuit that will convert a computer's serial port +/- 12 volt signals to the 5 volt data signals required by most radios. The schematic will work as a substitute for the Kenwood PG-4S and with the proper connection to the TH-6A plugs, will work for it too. No, I have not personally tested it.

I don't know what the comment below means, but all I know is, we used to be
listening to any
radio, broadcast or two way, and hear a bzzzzzzzzzzZZZZZZZZZZzzzzzzzzzz!
One of us
would comment, "There went a Ford", and, sure enough, look out the window to
see a Ford
go by. In over 30 years of installing HF radios in various vehicles, the
GMs were always the
quietest and required the least amount of noise abatement. It was because
their bodies were
bonded/grounded better. ......then there were those Ford cars that left me
stranded in the boonies,
so every car or truck since 1973 have been Chevrolet for me! LOL!

it means, simply, that there is very little in the way of 'good commentary' on the model CS-130 alternator, which GM started using in the late 80's to early 90's.

the old 10 / 12 / 15- SI's were durable, quiet, easy to rebuild, forgiving of a hot engine compartment, and electrically quiet

the CS's are short-lived, have noisy (mechanically) bearings, are a cast-iron SOB to rebuild, are prone to overheat and self-destruct, and are electrically quiet. but hey, 1 out of 5 ain't bad.

why GM started using this abomination is a mystery. perhaps it costs $ 0.000000001 less per unit to manufacture, perhaps the training of the chimps on the assembly line only takes 15 minutes instead of the 20 in the past, or perhaps its a typical case of an engineer having too much time on his/her hands.

whatever the case, the CS-130 sucks.....big-time

does that explain my comment sufficiently?

5034. Re: BIG Linears on ham why?Smeters

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-28 02:57:41 UTC
From: willy <willyacht@yahoo.com>
Message-ID: <9Z0D7.6601$c5.73063@newsfeeds.bigpond.com>
Source record: 52888

Since most S meters sample the AGC voltage this is no problem. It is very easy to calibrate a AGC voltage over many bands using a AD converter. When the AGC is DSP based it becomes even easier to achieve this. Kneiser Doering does this in one of the best DSP consumer grade receivers in the world. If you see what they have done with 16 Bit DSP technology it puts the likes of Icom to shame with PRO. This being achieved with a 16 bit DSP. This is the main reason why manufacturers are using or moving to DSP technology. That is because of cost savings and moving these operations into a controlled mathematical environment where all the factors you mention can be controlled. This is the only thing that separates the Professional DSP based equipment from the garden variety ham junk, that is how the manufacturers have learned to cope with all the DSP artifacts in their software alogarithms. If you have some time, go visit the Kneisner Doerings web page or better still go to the Radio Netherlands web page and download the review. You will see how they through good engineering practice have managed to make DSP technology workable in far superior way that most ham manufacturers can only dream of. Simply put they have better engineers and they not even a large manufacturer. They certainly offer a calibrated S meter which holds accurate to 1db. Icom could have done this so easly in the PRO2 its not funny. But again this is typical of the Japanese "not invented here syndrome" I have some old HP sig generators that are than 25 years old, HP 606's and 608s using valves and some of the oldest components that age very fast. They keep there calibration for years, i have one that is good enough to meet NIST standards. Yet you say this is so hard in this modern age. I simply say i have to disagree with you on this one. But hey you know my views on ham equipment manufacturers and this applies to all of them, they not trying hard enough. Even old radios like TS830s once set to 50uv keep a linear range of most bands down S4, at 5db per S unit and thats without trying. Cmon Bob, you know this can be done and its a simple thing to do.

5035. Kenwood TS180S

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-28 03:47:22 UTC
From: Tony Case <tcase@xtra.co.nz>
Message-ID: <kdLC7.2242$9M2.151207@news.xtra.co.nz>
Source record: 52938

I have a Kenwood TS180S. It has the following problem.

On Tune up in CW mode, with the RF power fully anti-clockwise it develops only 1.5 watts, whereas it should be 10 watts. When winding the RF power up to full clockwise - it goes up to 110W, and when winding it back, it drops to nothing at the 12 o'clock position and then builds back up to the 110 watts.

On SSB, when transmitting with power, it is distorted.

Can anyone help me with this problem? Please e-mail me at the address below.

Source record: 52941

Hello all,

If you had your choice of the above mentioned radios, which would be a better radio for a beginner? Both can be had new for about $170, and I've picked through the reviews at eham.net. It seems they are both good single band radios, each with their own merits, but each with their own flaws. Right now, I'm leaning toward the Kenwood because we have those rigs at work, and I borrowed a V7A over the weekend to play around with here at home. Does the Icom have a Signal strength meter built in? I don't see one in the specs, or in the pictures on the websites, but I'm sure it does. Have read with interest that both radios seem to have sporadic problems with the mic, and inability to transmitt, but that could be a whole host of other unrelated items. Thanks for any insight. Plan to use the rig as base unit at home, tied into a Jpole antenna or 1/4 wave ground plane. Have to make do for now.

Regards,

Van

Source record: 52946

FOR SALE: My company is now offering something for those interested in test equipment and electronics. I have compiled CD-ROMs full of military manuals on Fluke, Tektronix, and Hewlett-Packard test equipment, the three most popular makers in the test equip. business. I have sold piles of these on Ebay and other auction type websites, and I am now offering them for sale outright to anyone interested. If you wanted to get test manuals from these manufacturers, they'd cost you about $25 to $30 a piece, but these disks are full of government publications, much better written and organized than the commericial versions, for a fraction of the price:

15 Fluke manuals on CD-ROM: 31 megs of data, $7.95 per CD-ROM
46 Tektronix manuals on CD-ROM: 81 megs of data, $14.95 per CD-ROM
110 Hewlett-Packard manuals on CD-ROM: 289 megs of data, $24.95 per CD-ROM

OR

Get all three CD-ROMs (great for electronics business) for $40.00, a value of $47.85.

Shipping for US orders is $2.50 per CD, $3.50 for 2 or more.
International shipping is $5.00 per CD-ROM.

A list of the manuals offered on these disks is available when you Email mdavids@erols.com.

For ordering info, Email me at mdavids@erols.com. Thanks!

Mike
mdavids@erols.com

The 2100 is easily the better radio here.Better audio, intermod protection, etc. I see you don't mention Yaesu. Good idea since their FT-2500 was their last good monobander. Stay away from their 2600 and FAR away from their 1500.

Van,
I own a 2100H and well pleased with it. Have had it not quite a year. Yes, it does have a S-
meter. I use mine mobile with a 5/8 wave Hustler and have also run it in the house on a Ringo Ranger 2. Works great. If you get one and install it mobile, be sure you provide plenty of ventilation for it as it gets very warm especially running high power for any length of time. Good luck & have fun.

For the way my brain works (or doesn't) the Icom is easier to program.In the Kenwood manual there were some mistakes that may be fixed by now.In my opinion both rigs have a terrible front end when it comes to desense,so bad that they would not even be useable at my house with a good antenna or in the case of mobile operation would break squelch every few miles,if I wanted noise I would get a CB.The Yaesus seem to have a handle on this.With a J pole or 1/4 wave it won't be such a problem.....unless you work mainly simplex.TG

I'be been out of radio for awhile now and just recently bought a 706mk2g and a ah-4 I want to use this setup for my main station in the house. My question is which antenna should I use? Right now I have about 65 ft of wire up about 25ft feed directly to the ah-4 then a 8' ground rod 4' from the ah-4. I like to use 75-15 meters If anyone has suggestions please post them.

Aslo has anyone used coax to connect to their AH-4? If so does it work well?

I don't know about the crimp-on connectors -- but, if you get a copy of any ARRL Radio Amateur's Handbook, it will have extensive instructions on how to solder. As well as how to prepare and solder coax connectors.

Get the handbook, and a good soldering iron, and you'll be good to go.

The only coax attached to the AH4 (like the SGC auto tuners) should go between the tuner and the rig. The tuner is designed to feed a single wire antenna directly. Coax between the tuner and the antenna will be very lossy on those frequencies where the impedance is far from 50 ohms.

As for the actual antenna, basically you want to get as much wire in the air as possible. On the lower frequencies a good ground becomes more important as well. Burry as many radials as possible and attach to the ground lug of the tuner.

5071. Hum?

I "made" an unamplified D104 mic for my 2m Yaesu all mode radio using spare parts that I had lying around. I used a shielded wire from the mic head to the (coiled and shielded) mic cord and PTT switch. However, I am getting AC hum on my transmitted audio. I have checked all connections to my power supply, an Astron RS-20a, and transmitted without the mic hooked up to confirm that it was coming from the mic. Without the mic hooked up the transmit audio was clear. Any suggestions on how to cure this hum without using a different mic. Thanks!

the most important part of installing a PL-259 is your ability to heat the barrel assembly hot enough, fast enough to solder the braid thru those four holes, before the insulation around the inner conductor softens and deforms.

for that you need a large soldering gun with a heavy tip, or boat-anchor type iron.

lacking that, in an emergency, you can fold the braid (on small coax) back over the outer insulator, then twist the adapter down over it. this works unless and until moisture works its way between the adapter and the cable and corrodes the braid.

a helpful device is to take an SO-239 chassis jack and mount it horizontally on a secure base, then take a 6-32 bolt about 2 inches long, stack it full of flat washers and screw it into the center connector from the back side about 1/8 inch. solder that joint.

now, assemble your PL-259, and solder the center connection. let it cool, trim it, and insert the center into your 'home-made heat sink'; don't insert it to the point that the barrell meets the outer part of the 239. the mass of the flat washers will
drain away any heat making it to the center conductor while you're soldering the braid to the barrel.

after doing a few dozen of them you'll get proficient at it, its like anything else, practice, practice, practice.....your first few attempts will be ghastly, the next few sloppy, then it gets better.

Source record: 52876

Gary's advice about heating the barrel hot enough/fast enough is valid in my experience....what I often use in the field is a pocket butane torch.....just don't let the flame get right inside the soldering holes or you "might" harm the dielectric....A tip here also is to hang the connector straight down until cooled (less likely to deform insulation)....Once cooled (or just warm), NOW heat the pin and solder the center - Let it all cool once again before plugging it into that $$$ piece of equipment though (you'd be surprised what I've seen - must've been some burning fingers!).

A little patience and practice...and you'll have it down and consistent. I do a DC check (DMM etc) of the connection as soon as I complete the braid soldering...then again after the center pin, just to catch a short usually - valid only if there's nothing with DC continuity across the cable already (i.e. some 5/8 wave VHF whips etc).

Best of luck

> or you "might" harm the dielectric....

I once had a 2-way customer who insisted on doing his own installations on a new system of base and 6 mobiles.....after he was done he was on the phone, hopping mad : 'Those radios won't work over a half mile'.....

going out to his farm, I started to hook the Bird to the radio, and was AMAZED at how rigid the RG-58 was.....for about 12 inches back from the connector it was like # 10 solid.....well, it WAS solid.....with solder.

I asked him how he'd soldered the connectors on and he pointed to an oxy-acetylene rig that could have cut through the hull of the Titanic with very little problem.....he had (according to his son) used about half of a 5-pound spool of solder on 6 installations.....I guess once he got it flowing, it was a matter of 'more is better'.

I have for sale an excellent OMNI V, Model 562. It does have a slight scratch on the top cover in the right rear, this is hardly noticeable and the rest of the rig is spotless inside and out. This transceiver has a full set of optional filters installed, the 1.8, .5, .25 filters plus an additional 1.8 filter which can be cascaded with the NAR button selection on the front panel. This rig also has the optional FM adapter installed if you are into working the 10 meter FM repeaters. The VCO's have been updated and rebuilt by TenTec, documentation furnished. Full power output all bands. Original manual, power cord, and full documentation on installed options/updates furnished. This rig has been kept in a non-smoking environment all of its life--you will be hard pressed to find a cleaner one! Audio quality is outstanding. I have acquired an OMNI VI, otherwise would not be selling this beauty. $850. Contact me via email if interested.

Thanks,

Ron, AB5WG

>>
Paul,

You don't have to pray for QSO's! My AH-4 only has 35 feet of wire 10 feet
in the air (I do have a good ground, though), and I work all over the place!

Try a ground wire connecting the mic chassis to the radio chassis.

Sometimes the internal grounding thru the mic plug is not enough!

Hi Rob. Believe it or not, I think this is about the cheapest hobby you can get into. Once you get the equipment, there is no other cost. Golf, skiing, scuba, hunting, whatever else you can think of always, ALWAYS, costs more. The airwaves are free, and once you are set up then you can use this stuff to your hearts content.

How much do skis cost. Or guns, or scuba equipment , or golf clubs, or cameras or whatever. This stuff is a bargain!! ;^)

Jeff

Start out with used equipment, a hundred or so will get you on the bands for either hf or vhf, try the auction and swap areas.
Then, save your pennies until the jar is full, and get that new rig.
I bought and sold equipment, got it from swaps, then resold on ebay, it took a while, but eventually turned it into a new hf rig.
You could also part yourself out as an expert solderer, building people's kits for them, make a little money that way.

I have to agree with the first reply, my brother in law is an outdoorsman who does a lot of hunting and fishing. One of those out of state trips with or without a trophy cost a few grand by the time you throw in gas, food, lodging, hunting permits, ammo, etc. etc. Now besides the fun and enjoyment of being out in the woods hunting, financially, that's gotta be the most expensive meat you've ever seen. Same with fishing, (I'm not talking the local pond stuff here BTW). I can go downstairs into my radio room just about any time of day and use my gear in just about any type of weather outside (except T-storms) and have fun. I guarentee he can't go outside and play with his shotgun at 3 AM!!
Also you have to remember some of these guys have been in the hobby/biz for decades so these $500 transactions aren't touching every or the only rig they have. You have to start small and work up like what was said in some of the previous replies.

Good Luck,

Joe

I don't know where you are, but to go bat a golf club around here can cost as much as $100 a round.... I think the public courses are at least $25.

That's without the cart and the stop at the 19th hole BTW...

Joe

I com says you can't do this but in my experience you can.

To adapt my AH-4 to unbalanced output I made a SO-239 mount
and attached it to the AH-4 with one of the mount screws. I then
made a strap ground between the mount on the wire side and
the mount on the ground side of the tuner. All grounds are
gathered at the mount screw that attaches the SO-239 mount
From the SO-239 i have a short length of high voltage lead
terminated in a spade connector.

When I wish to operate long wire I attach the long wire to
the tuner output and when I wish to operate with coax I
attach the short lead and connect the coax to the SO-239.
I have been doing this for years both with SGC tuners and
the AH-4.

BTW the AH-4 performs quite well down to -30 F I established
that on the Iditarod last March. Also I have not been able to
get it to tune below 80M yet.

Good Luck 73 Jerry KK5YY

I have a chart (from a magazine article) that shows long wire lengths to use and/or avoid. These are the lengths to use - all in feet.
28
39 1/2
58
76
96
109
145
I have moved my wire and cut off andn added a piece so right now I am no sure how long mine is and I am getting good reports with it. I am going to put up a new wire shortly now that I have it where it works good - lot of tree cover in my yard

>
You can *if* the load impedance of the antenna is such that the SWR on
the coax is something reasonable. If the SWR on the coax is say 10:1
then even if the tuner matches it, the loss will be very high in the
coax. You'll get the best frequency coverage with minimum loss by
feeding the wire antenna directly with the tuner.

5111. Digital SWR/Power meter DAIWA DP830

Helo,
I need some help if anyone can help me.
I have digital swr/power meter Daiwa DP830.
It's a great thing, but some electronic component died
and it won't work.
Only clock work as well, nothig else. SWR doesn't show me anything
and power meter shows me 4,5W on higher power and something less on
lower power on each sondas.
So, if anyone could help me I would be thankful.
I would fix it by myself but I don't have osiloscope.
I've allready wrote to Daiwa (think store) but nothing from them.
One more thing, if some of you know any e-mail address or web page in
Japan please let me know.
Thank you.

So what, that isn't what the original poster asked he asked if
an AH-4 could be used with an unchallenged output.
The answer short and sweet is yes it can.

There are applications where a coax feed if much superior to a long
wire or balanced antenna. I wrote what I did assuming that one of our
ham colleagues who had studied and passed his tests might actually
understand the implications of excessive coax together with a
non-resonant antenna. You sir don't seem to share my faith.

Bottom line the tuner can be used with coax with a simple modification
how it might be used is beyond the scope of the question.

An AH-4 is simply a tool subject to use and misuse as any tool. That
said I feel no need to lecture my fellow amateurs on subject areas
where I am sure they are competent. As is obvious, I do, however,
feel free to lecture the lecturers.

Hi,

I have an Icom AT120 auto-tuner, a marine version of the AH series and somewhat older than the AH-4, which I use with my IC-746. I wonder if anyone has used an AH-4 or similar Icom tuner with a Delta Loop antenna and if so, how did it perform?

SGC's manuals on their Web site show their Smartuners being used with dipoles, loops and squares, one side being fed from the normal antenna stand-off insulator and the other side from the ground terminal, there being no real "ground" attached to the tuner in this configuration. I can't see any reason why the SGC would work and the Icom not but I'd be interested in hearing of other's experiences.

TIA,

Brent,

The output from the AH-4 is made for single wire only. You could use a balum on the output but that would not be a great idea.
The more ground you can put in the better. It depends on what kind of earth you are on also. Sandy earth requires more ground rods. You may also have better luck if you don't make the wire lenght so close to 40 meters 1/2 wave. Make it about 10' longer and let the tuner make it happen for you. Your antenna is what is called an 'L' shapped configuration. If you were to put down about 12 wires on the ground, around the AH-4 about 65' long you will see a great improvement in your signals.

Get a copy of the ARRL Antenna handbook and this will help you to get better results for sure.

Good luck with it and have fun....

John w1hzh

Well, you can also go to the Ten-Tec web site, and ask that they email their
list of traded-in, reconditioned equipment. You can find some real bargains
there, and you know the stuff works, coming from their factory service
department. You shouldn't have any problem getting on the air for $500 to $1000,
including transceiver, speaker, power supply and antenna.

By the way, once you've messed around with the hobby awhile, you'll discover a
simple truth: most hams are damned cheap :-)

I have had the AH-2, a predecessor, for about 5 years. Its been worked hard for most of that time on all bands. It has handled 99 percent of all the many random wire inverted-L and T combinations I have thrown at it from 160m to 10m.

As a precaution there is a 450pF variable capacitor and a 5 uH coil to be connected by alligator clips in series with the antenna wire should the rare need arise.

The relay contacts must have had millions of operations with 100 percent reliability. Transceiver mainly the 100 watt Icom 735.

I am looking for recomendations on computers that are resistant to RFI from H.F. radios. Are any brands of computers known to be better than any of the others ?

: > Gary's advice about heating the barrel hot enough/fast enough is valid
: > in my experience....what I often use in the field is a pocket butane
: > torch.....just don't let the flame get right inside the soldering holes
: > or you "might" harm the dielectric....
:
: I once had a 2-way customer who insisted on doing his own installations on a
: new system of base and 6 mobiles...................after he was done he was
: on the phone, hopping mad : 'Those radios won't work over a half
: mile'.................
:
: going out to his farm, I started to hook the Bird to the radio, and was
: AMAZED at how rigid the RG-58 was..........for about 12 inches back from the
: connector it was like # 10 solid..................well, it WAS
: solid.................with solder.
:
: I asked him how he'd soldered the connectors on and he pointed to an
: oxy-acetylene rig that could have cut through the hull of the Titanic with
: very little problem...........he had (according to his son) used about half
: of a 5-pound spool of solder on 6 installations..............I guess once
: he got it flowing, it was a matter of 'more is better'.

LOL!

I wish I had more customers and rework like that!

Crimping works just fine if done properly unless weather or salt air
is a problem. Still, any outdoor connections should be well protected.

If crimping would be a problem because of a braided shield, then
hardline with proper clamp type connections should be used instead.

If you are willing to use older equipment, I highly recommend an IBM PS/2- and if you can find a 9595 or one of its brethren, go for it- the Microchannel bus was designed with RFI reduction (both emission and acceptance) in mind, and the bodies are very, very heavy gauge steel. When everything is tight, they don't leak much, and they certainly can accept RFI. Mine sure did.

FT-100 with YSK-100 Seperation Kit. Small scuff on the main tuning knob and slight scratches on the VFO/MR, Step, and Lock buttons. Nothing major, just some slight stuff. Includes box, mic, manual, mounting bracket, and power cord (cut and spliced back at the fuse end for installation). I'm selling because I just bought a 98 Civic and have decided not to put a radio in it. I'll accept a money order or personal check (I'll ship the radio when the check clears). $650 shipped in the lower 48 states.

Amen! on the model 95 ps/2. Most of the time, you need to worry more about noise from the computer getting into the rig. Cheap computer power supplies are the biggest culprit. Another quiet, rf proof machine is any of the old Compaq laptops. I've spent a lot of time logging on an old Compaq 286 SLT using LogEQF with the computer sitting right between the rig and the amplifier. Nary a flicker. I picked up one of these at a State surplus auction for only $15.00 including power supply. It's really all you need for logging and packet.

Thanks John!

I have about 60 ft of wire up 25ft in a L shape fasion. I have a 8' ground rod outside the shack I have a piece of #14 about 65 ft that runs along the house foundation. Also connected to the ground rod is a 10ft piece of #10 going to the shack. I have the tuner inside the house mounted to the wall in the basement. Should I move it out side? I'm not sure if it would work in the winter. It gets pretty cold up here in GreenBay,WI The manula says that it should not be used if it is colder than 15 -F I would have to say it stays -10 - 20 -F During that season. I'll try and take some pictures and post to my web site so you can see how it is set up.

Well, what kind of station are you trying to put together when you say
a "technician class rig"? What rig? Antenna, etc.? It doesn't have to be
that expensive. It CAN be an expensive hobby but it doesn't HAVE to be.

In my quest to determine which of the above radios would be more useful as an emergency radio for working with the local chapter of the Red Cross, it was pointed out to me that I should make sure whatever radio I buy can be modded to transmit in the Mars and Business Band frequencies, as many radios can. Apparently, the local chapter uses those frequencies as well as 2 meters.

So, which of the following radios can be modded for expanded transmitting range:

Yeasu FT-817
Kenwood TH-F6A
Kenwood D7A

Thanks for the additional input. I really appreciate it.

-Mark

They work. I'd rather have soldered connections for a long term coax
though. But I've used those cheap rat shack crimp on jobs for rg-58
many times and have never had a problem. They are handy for camping
/portable etc where you never know when you might need to rig a
connector and might not have a soldering gun or power around. MK

Stray shunt capacitance at the output of a random wire tuner can lead to excessive losses. These tuners are not designed for low impedance coax loads. Beside you might get a high current point and ruin an already marginal tuner. Its everyone's mission in designing efficient antenna systems to reduce stray C. If you want to play with coax loads get a tuner that will handle those loads. Huge currents can flow. The Icom manual is specific of antenna lengths etc, they say this for a good reason.

If you going to modify this tuner, you might as well just get a high efficiency low loss roller inductor tuner, that will cope with coax.

Nope, the LCD display has it's own driver and is a plug and go install
except for the 781 where you have to lift a circuit board.

I personally wouldn't choose any of the radios, because they're all 5-watt jobs. That's not really enough power for reliable communications in emergency situations.

At the World Trade Center, hams have been helping out with communications, but they had to start turning away the guys who were showing up with handy talkies, as they could not reliably hit the repeaters around Manhatten. They ended up asking the guys to bring mobile-type radios, 40 or 50 watts minimum.

As far as mods go, I don't know if a ham rig can work on business-band nets where radios are programmed for particular channels with software from Motorola and other similar companies. (But I'm no expert here -- others may be better versed -- I just know the Motorola Maxtrak out in my truck is a real different animal from any of my ham rigs.) You might be better off picking up a used business band radio, on the cheap... and something like an ft-100 or 706, assuming one will work on military affiliate radio frequencies.

Why don't you ask the guys at your emergency center what they are using?

I'm looking for a new ht. I'm considering the yaesu Ft-51 ft-50 ft-470
and the hx 202. I really would like dual band because the 440 repeaters
are pretty active. Please send asking price to carrwill@home.com
Thanks,
-DC

> I personally wouldn't choose any of the radios, because they're all 5-watt jobs.
> That's not really enough power for reliable communications in emergency
> situations.

I understand what you are saying, but the 5W output isn't really a problem around here. You can easily hit pretty much my whole city w/ 5W simplex, and the local repeaters are high enough on nearby mountains that they can be hit from anywhere w/o interference, and I've never had trouble hitting them with an HT set at medium power.

I'm mostly looking at getting a radio that is small and convenient for me to tote around if I want to for fun, but could still be usefull in emergencies if I needed it to. I almost never rag chew, so I am loath to put the money into a more expensive VHF portable that is more of a pain to move and set up. The FT-817 intrigues me because I think that 10m QRP would be kinda fun on the local mountains.

> Why don't you ask the guys at your emergency center what they are using?

I did. They were also thinking of upgrading to the TH-F6A if it can be modded. They have the more powerful mobile 2m rigs set up in the emergency center and in their vehicles, but they still like HTs for carrying, too.

Watch the classifieds in the nearest city. Kansas City classifieds has one right now 40 foot tower with antenna $150.

This is the best way to buy one -- if you get one on the ground. You might want to be a bit hesitant about taking one down, since they can be kinda tricky if you don't know what you are doing. some of the Rohns can stick together making disassembly a bitch.

MOST fellas bitching about others using high power seem incapable of comprehending that not ALL
stations in the roundtable, or members of the group perhaps not yet present, are hearing each other
equally strongly as the "linear complainer" is!

I commonly engage in 20 meter QSOs where SOME of the group are QUITE strong, but others can barely
hear each other - sometimes including the ones *I* am hearing the loudest. I may well START a QSO at
low power - and manage to connect with one of my group who is hearing me OK - but OTHERS we want to
also join our group might NEVER hear our QSO in progress at the low power WE are able to use just
between us! Frequently the LOWEST power needed to maintain contact ALL the way around the group is
the MAXIMUM allowed by law...

For SOME, 1500 watts isn't nearly enough...
To OTHERS, 5 watts is "too damn much"...

Can't please everyone, complaining is all some seem to live for - Hell, I gave up even trying!

Does anyone have a copy of the owners manual?

5164. Scanner Suggestions

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-30 05:19:03 UTC
From: Frederick Bray <fbray@mminternet.com>
Message-ID: <3BDE3847.FEB57FA2@mminternet.com>
Source record: 52717
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

I am considering updating my scanning gear.

I would be interested in feedback from folks who have used the BC780XLT and the WinRadio 1500e, especially those who have compared the two. It appears that while more expensive, the WinRadio has more potential for growth / expansion.

I read the early reviews of the1000 WinRadio and it appeared to have a number of technical shortcomings when compared to other scanners / receivers. That may well have changed in the intervening years. If anyone can point me to a more recent review of the 1500, that would be appreciated.

I am interested in comments on sensitivity, selectivity and intermod rejection, etc. I would normally use the unit for VHF/UHF rather than HF, since my ham gear adequately covers the latter.

Thanks in advance.

5165. Re: Where do you guys get all this money?

BE careful the old adage ... If it sounds too good to be true it usually is. Many good rigs can be found for not much money but most of those are older and tube finals however still good radios such as the Yasue FT101 series, Kenwood TS520,S or TS 820S series radios.

The caution is because there was a "Ham" using that word very loosely that advertised a Yasue FT 101 for $50.00. Several people sent money orders plus a little more for shipping and never got the radio. All they got was a bogus UPS Tracking number so just be very careful and try and work out a mutually protective way to buy between you and whoever you deal with. Another post mentioned TenTec who is a very good company and usually has a 30 day (less shipping) money back guarantee on new and used/demo equipment.

Although I do not have the WINradio, I do have the 780xlt and a
PCR1000...
After using both units, the 780 seems to be superior in most respects.
I have read reviews of the WINRADIO
in PASSPORT TO WORLDBAND RADIO, and other magazines. I believe the 780
for UHF/VHF scanning to be one of the best
out there... Chris..

5172. Wanted: small HV power transformer

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-30 14:19:51 UTC
From: k5dh@raytheon.com
Message-ID: <bGyD7.4$284.95@dfw-service2.ext.raytheon.com>
Source record: 52726
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Greetings, tube-gear fans...

I'm looking for a small HV power transformer:

Primary: 110 VAC

Secondary: 300 to 350 VAC center-tapped at 50 to 100 mA
--- OR ---
150 to 180 VAC without C.T. at 50 to 100 mA

Filament: 6.3 VAC at 2 to 3 A
--- OR ---
12.6 VAC center-tapped at 2 to 3 A

Size: No more than 2-1/2" W x 3" D x 3" H

The application is for the power supply in a homebrew 80m
and 40m tube-type VFO. After full-wave rectification and
some stiff filtering, I want to wind up with +200 to +250
VDC for the cathode follower and post-amp plate voltages,
and I'll use a VR tube to regulate the oscillator plate
voltage. I am very constrained on space in the cabinet
(which is why I specified that small of a physical size).
Anyone have something in that range that they can sell me?
Yes, I'm aware that Antique Electronic Supply and other
dealers sell new power transformers, but their cost is
astronomical. I'm trying to do this "on the cheap" with
all junkbox parts.

Dean,

You should be able to get 300V @ 100mA using a half wave voltage doubler and use a separate filament transformer. I'm not sure if you can fit it in your space, but breaking it up into two devices may help. The cost will probably be less, too. A couple of 150 uF@450V , a couple of diodes, a surge resistor, and a few bleeder resistors should do the trick.

I recently did this for a German tabletop radio I had bought with the transformer missing and it cost less than $15 including a Radio Shack pc board.

Consult most any electronics book or the Radio Amateur Handbook for a schematic, or email me and I'll send one along to you.

Good luck.

November 6th 2001 there will be the activation of HV5PUL radio station from the Papal Lateran University, in The Vatican State.

The activation concerns: HF 18/14/21/28/7 MHz and 144/50 MHz. Transmission modes are CW/SSB.

Four radio stations are going to operate at the same time, two in CW and two in SSB, from 8.00 GMT to 17.30 GMT.

QSL via HV5PUL 00120 Vatican City

Source record: 52737

I am presently working on a project for a portable HF/VHF/UHF station. I will be building a wooden box that will contain the following:

Ten-Tec 544 (Triton IV) for HF work
Timewave 599ZX DSP
Yaesu FT-2500 2m mobile for VHF (Will be replaced with at dual bander as money permits)
MFJ 949E antenna tuner
PK-232MBX for HF/VHF packet/data modes

This will make a nice one box portable for operation at my trailer in Virginia and emergency op as necessary. Box is designed with removable wheels and pull handle, two side handles to lift to table.

I am planning on operating the equipment above with a 30 amp switching supply to save weight. I have heard a number of people comment on switching supply noise in their operating enviornment. Does anyone have any input on which is the least offensive in a close proximity to the radio equipment?

Thanks for the input. Ed/N3WJA

I agree we all save most of our money !

We are old and young and middle aged guys and gals that have lots of fun
with our stuff.

Even bowling can cost money every trip to the lanes. Sure, there are a few
guys in my club that have nice jobs and can afford to buy any radio anytime,
and they always pass on the older radio to another member at a fair price.

Check out www.arrl.org and locate a local club in your area.
Many times lots of good gear is traded during hamfests or local club swaps.

I got my kenwood ts 520 on ebay, estate sale, good deal.

Find a nice radio selling local to you, most of the time you can arrange
local pickup and save the ship and pack fees. ask seller in advance questions.

Keep looking on ebay and learn the radios by sight, you can use this
experience at the hamfests. Or a local ham can help you at the hamfest.
Most will let you test the rig at the hamfest. some will not.

Many radios are on auction because they are no longer used or the buyer
gets his credit card bill and has a reality check !

Just do your homework and you will be on the air soon !

I don't have input on a switching supply, per se but...

I have a 25' fifth-wheel travel trailer with a built-in Todd Engineering (now out of business) switching 30A battery charger.

With the trailer parked beside my house and pluged in to house AC I have severe interference to both the lower ham bands and up to channel 4 TV. I am in a weak signal TV reception area with some snow, but the noise really wipes the picture out.

It took me a while to find this. I finally acquired an Icom R-10 receiver to use as a sniffer and chased it down. I have been a ham for 40+ years and spent 33 years in the rf/microwave business, including some rfi-emi work and I have yet to figure a way to suppress this noise. I have brute-force filtered the AC line and tried all of the usual tricks on the output. One problem is that the case radiates, even though it is primarily an extruded heatsink with a well attached cover and in the trailer, there is no well defined ground point.

I would look at an inexpensive analog supply if I was you. I use the Astron 35A on my TS870 with no problem. If I had room in the trailer, I would put one in to charge batteries.

In the ARRL lab tests, the MFJ MFJ-4225MV (25-amp ICS, 22-amp
continuous) was the quietest. I'm not usually a fan of MFJ products, but
I have one of these supplies and it seems to be dead quiet across the
HF-UHF spectrum. Seems to be well made too, though the fan is a bit
noisy. You can cure the fan noise by intalling a pot or resistor (in
parallel with a capacitor to ensure that the fan starts) in the fan's
power line.

The trick to crimped connectors is to use good ones (not the Shack stuff). Amphenol makes the best. They are all I use. One possible problem is the price of the crimping tools, about $200 and up.

From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <gWGD7.275$QL2.25123@e3500-atl1.usenetserver.com>
Source record: 52751

Well,

Most of us started out slowly and didn't just rush out and buy everything we needed to set up a first
class A-1 radio room. Hams like me built up their radio stuff over many years, buying mostly used
stuff and trading up, selling and buying at hamfests, etc. I don't go around swapping off radios much anymore. I kept an FT-757GX for 10 years, I still have a Swan WM2000A wattmeter
I bought in the late '70s. I do look at some of the rigs in the catalogues and mentally gasp at
the prices. Still, with careful shopping, one can build up a useful "arsenal" of radio equipment
without breaking up the exchequer--it just takes awhile to do it.

Not only that, like you, I am also a woodworker. I started out with that in much the same way.
Thirty years ago, the first real tool I bought was an electric drill. Then over time I acquired, one
by one, more and more tools by secret purchase (to avoid wifely wrath!), or Christmas and birth-
day gifts from family. The coup d'etat was the Shopsmith my Dad surprised me with a number of
years ago! It was old, but quite well cared for and had many accessories, and that gave me reasons to go out and find even MORE Shopsmith attachments and tools. All in all, I don't think
either hobby is excessively expensive--if you are "pore" like me, it just takes longer to acquire
these "treasures".

I don't know about RF getting into the computer, but plenty will get OUT
from some PCs.

As others have stated, the well-built IBMs are pretty clean. I have an HP
Vectra that's clean too.
3 other machines here were very noisy. 2 homebrew and an old E-machine
(300Mhz).
I was able to completely clean up those 3 with RFI/EMI filters that I bought
surplus and installed in the power supplies.

I've not had issues with RF getting into the computers, but I only run 100
watts into low-SWR antennas.

> be less, too.

The power you want to handle is, approx.
Hi Voltage: 15 to 35 watts.
Filaments: 13 to 25 watts.
Total: 30 to 60 watts. First transformer.
Hi Voltage: 15 to 35 watts. Second transformer.
Was going to suggest two 110 volt filament transformers back to back.
Heaters off the intermediate connection at 6.3 or 12.6. Voltage double
from the output (primary), now the secondary of the second transformer.
115 x 2 = (roughly) 230 volts and filter it. The two separate
transformers might be easier to fit in available space.
Just an idea.

If you're not familiar with the SA-2500, it was the last in a line of 2KW HF Antenna Tuners, and the first (and only) Heath Automatic tuner - - - using a motorized inductor and motor-driven capacitors which are controlled by an electronics package that senses minimum SWR

Tunes all bands 160-10 meters. Handles up to 2KW. Offers dual wattmeter and SWR that reads 0-200 or 0-2000 forward and 0-50 or 0-500 reflected. Digital readout turns counter. Audible warning when a user-selected SWR is exceeded. Manual tuning & touch-up available using three spring-loaded lever switches.

18 user-defined Preset positions to speed tuning. On the rear panel are two SO-239s for coax-fed antennas, one SO-239 as a bypass to a dummy load or resonant antenna, and a very large feed-through insulator for single-wire, end-fed antennas. Also at the rear panel is a connector to supply 12 VDC power, and even provision for remote control (choosing amongst the 18 Presets) if your transmitter or transceiver provides a switch closure to ground...

5203. Need Manual Icom IC27H

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-31 01:28:10 UTC
From: Gary Johnson <wy0v@cableone.net>
Message-ID: <ttukq2ff4adv85@corp.supernews.com>
Source record: 52757

I picked up an Icom 27H at a recent flea market - real cheap. It transmits and receives OK, but the receive audio is very low. I'll bet it's an easy fix, but I will need a schematic. Does anyone have the schematic or service manual available? I will be happy to pay for any cost involved. If you can help, please reply to my direct e-mail address listed below.

Thanks - Gary - WY0V
wy0v@cableone.net

5204. Grundig eTraveller, Sangean CC, GE 7-2887 Comments?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-31 03:25:35 UTC
From: Al Barnhard <TrueUp@yahoo.com>
Message-ID: <ekrutts93v8gs3gh2d89pl9lvgjfbc5hr3@4ax.com>
Source record: 52758

Looking for an uncomplicated radio for my middle-aged non-tech lady.
Mainly it should be good at bringing in AM in a fringe area with lots
of interference. No interest in SW, but FM and NOAA a plus. The
smaller the better. Price is OK up to $200.

I'm being steered toward the following (from Universal Radio):

Sangean CC Radio @160 - 11" x 6-1/2" x 4"
Grundig eTraveller VII @130 - 2.7" x 4.5" x 1"
GE 7-2887 Superadio III @ $60 - 12-1/2" x 10-1/2" x 4-1/2"

I would be grateful for any comments on these or suggestions as to
other possibilities.

Al B.

: The trick to crimped connectors is to use good ones (not the Shack stuff).
: Amphenol makes the best. They are all I use. One possible problem is the
: price of the crimping tools, about $200 and up.
:
: Chris
:
If you shop around you might find one as low as $50, but you could wind up buying 5 or 6 before you find one that really
works. Then be scared to take it to work and get it stolen!

vtail@hotmail.com wrote:

>
>Anyone know if the Icom IC-27A 2 meter FM rig can send PL tones?
>
>If so, how is it done?

Yes, it can. Following is from the manual:

The IC-27A is equipped with a subaudible tone encoder. By pushing the TONE SELECT button, the FREQUENCY DISPLAY shows a tone number instead of the operating fequency. While holding the TONE SELECT button, by turning the TUNING CONTROL, the displayed tone number can be changed. Turning the TUNING CONTROL clockwise increases the tone number and counterclockwise decreases the number.

The subaudible tone frequencies can be set by selecting the tone numbers.

I won't type in the whole tone number vs. tone frequency table. Tones 1-38 are the standard CTCSS tones in order from 67.0 to 250.3Hz. Tones 39-44 are 500-1000Hz in 100Hz steps. 44-55 are various frequencies from 1300 to 2975Hz, not in ascending order. 56-63 are undefined.

More from the manual:

When selecting a number except "00" the tone circuit is turned ON and the letters "TONE" are indicated on the frequency display.

When selecting the number "00", the tone circuit is turned OFF and the letters "TONE" are also turned OFF.

This tone number is memorized into the VFO or MEMORY CHANNED which is selcted when the tone number has been set.

The subaudible tone is transmitted when the set is in DUPLEX mode only, even if the tone indicator is illuminated.

Horsetrading. That's how I got my rig.

I was fortunate enough to win a DVD player at a trade show. I then traded this for a dual band vhf/uhf rig that I used for a while. This I then later traded for an HF rig, an Icom 745. Cost: FREE.

I got a good deal on my antenna tuner too. I was going around the Birmingham Hamfest, looking at all the flea market tables. I found one dude who had sold off everything but his tuner. This thing was almost new in the box, and sells for 150. He had a price on it of 100. Since it was the last item, I guessed (correctly) that he wanted to sell it and get out, so I offered him 75, cash. He snapped it up, and I got a practically new tuner for half price.

At another swap meet I picked up a small vhf amplifier for 15, and a power supply for 10 bucks.

Moral of the story, figure out what you have to trade or sell. Use this to generate cash or stuff to trade with. Then go to swap meets and hamfests, and check out the tailgate and fleamarket sections. Often slightly used equipment can be a really good deal.

Also, Christmas is coming, might be a good time to hint to the YL about a radio. My terrific YL bought me a Radio Shack 10 Meter rig (139 bucks on sale) for Christmas, to celebrate the fact I'd just passed my General. What a gal!

1. Increase the length of your wire to about 76 feet. If going inverted L--try to get the vertical portion as high as you can.

2. Put at least one radial about 76 feet plus 10% directly under your elevated wire.

3. Put several other radials at least .2 wavelengths long on either side of the one in #2 above.

4. Seal up the control cable and coax connections on the coupler well--and point them down if you can. Protect it from direct sun and large hail.

The directions for the AH-4 coupler indicate how to attach the coax to the coupler. If you bought yours new, you must install the PL-259 connectors on the supplied coax or coax of your choice. Put your coax through the wx boot first!

DO NOT USE COAX ON THE OUTPUT SIDE OF YOUR COUPLER--REGARDLESS OF WHAT OTHERS MAY HAVE TOLD YOU! The coupler is for end feed and balanced feed only.

You may attach the coupler to a loop antenna by attaching one end of the loop to the output lug side of the coupler and the other end to the ground lug. Depending on where you place the coupler in the loop will determine direction of gain and polarization of your signal, as well as nulls.

You can attach 450 ohm ladder line to the coupler in the same fashion--just split it enough so you can hook one wire to each lug. Hook the other end to a dipole cut for the lowest frequency you intend to operate on. 100 feet of ladder line seems to work well on all bands with a dipole from 88 to 130 feet.

You do not need radials with the loop or ladder line feed.

The coupler is NOT designed for use with a coax fed dipole. Do so at your own risk.

The AH-4 coupler is NOT designed to work on 160 meters. Do so at your own risk!

The AH-4 coupler is NOT designed to work below 7MHz with an 8 foot whip. It will work great on 80 with a Hustler mast and 80 meter coil, or an 80 meter Hamstick type antenna, but not so well on the higher bands with these antennas--replace them with a plain steel whip for 7MHz and up.

You can make extension cables for the AH4 coupler. I have run couplers 200 feet plus distant from my rig. Use good quality coax, such as 9913F and decent size 4 conductor wire for the control cable to combat feed line loss and supply voltage drop.

DO NOT USE COAX ON THE OUTPUT SIDE OF THE COUPLER. Coax should only run between the rig and coupler. YOUR ANTENNA STARTS AT THE COUPLER OUTPUT.

5227. Astron RS20M just blew up

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-31 23:24:12 UTC
From: Jon Knutson <jknutson@starband.net>
Message-ID: <SK%D7.8375$LU1.2053673000@twister2.starband.net>
Source record: 52781

I have been using an Astron RS 20M and was doing RTTY today when all of a sudden --nothing--. I have removed the RS20 from the radio and it will not power up any longer. Obviously I pushed something too far. What should I look for and what are the chances it could have damaged the radio in the process? I don't see an external fuse is there one inside? I don't have a schematic, so not sure what to look for. There was no smoke or burnt smell. Any ideas as to where I should start??

5228. Tubes vs. Solid State for SW Receivers

Newsgroup: rec.radio.amateur.equipment
Date: 2001-10-31 23:26:06 UTC
From: noring@olagrande.net
Message-ID: <9rq1ae$la4$1@og1.olagrande.net>
Source record: 52782
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

I admit that the question I will pose is open-ended and may
not have a clear-cut answer. And answers may likely include
the phrase "Depends on...".

Nevertheless, let me pose it:

"In terms of shortwave reception performance, which type of
electronics are inherently, and in actual real-world
receivers, better: tubes or solid-state?"

When I refer to "shortwave reception", I mean all forms of
reception (AM, sideband) from the 500khz to 30mhz, and for
all forms/types of broadcasts (ham, international broadcast,
etc.)

When I refer to "performance", I mean the ability to pull in
very weak signals and to reduce interference from adjacent
stronger signals. E.g., sensitivity and selectivity. Also,
delivered sound quality is important for understandability,
and comes under this question if it can't be separated from
the receiving circuitry. There may be other benchmarks as
well which are important but I haven't mentioned.

Of course, there's the possibility of hybrid circuits, using
a combination of vacuum tubes and solid state devices (such
as transistors).

I'd like to know what makes/models of radio(s) throughout
radio history up to the present are representative of this
'best', or close to it. Also, I and others would like to
know which "budget" radios of today come closest to the
'best' performance.

I look forward to the discussion and to learn a lot from it.

Thanks.

Jon Noring

Not again! Well, IMO, tubes allow for a greater audio range. But compared to modern day solid state equipment, they fall short. In the old days, you basically had to guess where to tune on the dial for a station. Thanks to PLL and digital tuning, you don't have to anymore. Although you conceivably COULD add a digital freq readout to your old tube set. Miniaturization adds a lot of stuff that the old tube sets couldn't have. If 1 tube =1 transistor, then just the amount of transistors in a modern set gives it an edge, not counting the microchips in there too. The bad part is that concievably a modern rx could have more trouble with power spikes and such, but that is outweighed by the pluses.

Had about the same experience here running some 10M FM on my TS450S
and an Astron RS20M. Astron tech support told me that with a 100W HF
rig the RS20M was not recommended. They did however repair it free
under warranty. I have since upgraded to the RS35M and no trouble.

The failure mode on mine was the pass transistors "opened". Those are
the two large devices mounted on the heatsink.....good luck....

In my question I specifically focused on shortwave reception
performance, not on the obvious plus of PLL and digital
tuning, which makes for a lot more convenience and knowing the
exact frequency.

Can modern state-of-the-art solid state designs have
comparable if not better sensitivity and selectivity than
state-of-the-art tube designs? (There may be other measures
of reception performance, but sensitivity/selectivity are
the two I know of.)

There should be no inherent difference between tubes and solid-state. A signal doesn't care whether it's amplified in a tube or a transistor, etc. People like me collect tube boatanchors because they are historically interesting and, well, cool, not because they have some intrinsic advantage over solid-state gear. There is much discussion of tubes vs solid-state in audiophile circles; I think most of it is hooey (please no flames, this is just my $0.02 :-).

You may get a lot of opinions on what receiver is "best," since there's no agreed definition. For example, if you discount audio, then I'd consider my Hallicrafters SX-42 and Hammarlund HQ-180AC roughly equal. But the Hallicrafters has a superior (i.e., push-pull) audio section, so I guess it's "better" if audio quality counts. On the other hand, the HQ-180AC was made about 20 years later than the SX-42, so how should that be factored in? And should appearance count? The SX-42 has a distinctive, widely praised design, while the HQ-180 looks more like a piece of lab equipment. And so on . . .

That being said, the best boatanchor that I own is a Hallicrafters SX-88. (See http://antiqueradio.org/comm.htm .) Many people think the military R-390/A is one of the finest tube receivers ever made. There are many other good ones out there.

Regarding today's radios, wouldn't you expect a lot of them to perform better than equipment designed fifty or sixty years ago? Science marches on, and I think electronics has been no exception. When I got a cheap (around $100 used) Grundig YB400 a few years ago, I discovered that it seemed to pull in anything I could get on my favorite boatanchors, using only its built-in whip antenna. This bummed me out a little at first, but then I decided I was happy there had been some progress in electronics during my lifetime :-)

You can read many reviews and comparisons of current shortwave equipment at the Radio Netherlands website:

The crowbar may have tripped from stray RF or a transient. Turn it off for several minutes, and turn it back on. It may go back to work.

Otherwise, the pass transistors or the LM723 IC are suspect. These are fairly rugged supplies--I have at least 30 of them in signal cabinets along a railroad right-of-way and they rarely fail.

This answer makes sense in the context of the question being HF
reception. However it is not true as one goes up in frequency. At UHF
frequencies, a modern solid state RF amplifier first stage (GaAs FET for
example) is inexpensive and has a better noise figure than any available
tube amplifier.

Not much contest, but the 1A was quite a good receiver in its day. Its
value nowadays is more its rarity.
Something like a R4-C, apart from the difference in coverage is likely a
better performer than the R8B in many respects.

5241. Car power for mobile radio

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-01 01:20:42 UTC
From: gdsnkl@bellatlantic.net
Message-ID: <3be09c52.6528090@news.bellatlantic.net>
Source record: 52795

Just ordered my first mobile radio, moving up from an HT. The power requirement at full power, 12 or 13 amps, is a bit much for a cigarette lighter.

I'm wondering if those with more experience could reply with some of the issues involved with running wires from the battery into the dash area.

I'm looking at doing up two cars to be able to plug the radio into some sort of connector. The Powerpole standard is appealing, so I could do a portable battery pack the same way.

How best to add the connection at the battery end (top post)?

Ground to neg battery terminal or to the frame?

What to avoid in going through the firewall?

Any ideas on a releasable mount for the radio? I would be great to be able to pop it in and out with the two cars.

I've got a magmount antenna for now, will deal with that end later.

TIA,
Happy trails,
Gary (net.yogi.bear)

Hi,

Well like anything the answer depends a lot on what you call similar radios. If you compare an R-390 to a modern radio costing the same dollars new you will get one comparison. If you adjust 1952 dollars to 2001 dollars you will get another comparison. If cost is no object the comparison will be different as well.

Assuming you have a lot of money to spend then solid state wins every time. Most of us don't have radio budgets that start at $250K and go up from there. Not many of us ever see such radios let alone get a chance to use them.

Enjoy!

Oh. Ok, here's what I know: I had a Hallicrafters that had a knob for "selectivity". I guess this was a crude attenuator. All I know is that it never seemed to make much of a difference in the actual sensitivity/selectivity of the reciever except to slightly tone down stations that used big kilowattage like the Euros. You have to consider too that tube stuff will have paper caps that have gone bad and resistors out of value and such that will reduce the effectiveness of the reciever. Solid state stuff is much less likely to have such problems, probably because the quality of the components were better to start with. Also a lot depends on your antenna, and THAT is more an art than a science. Now if you want a debate on "which were better new, tubes or transistors?" then you'll have to talk to some of the old tube guys on here.

5244. WTB: National air variable cap 5pf/5pf

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-01 02:06:11 UTC
From: John Derrico <jderrico@aplus.com>
Message-ID: <3BE0AE12.9F74224C@aplus.com>
Source record: 52797

I need an air-variable cap for a National NC-173.
I think that it is common to many national radios that have
a Crystal Filter Phasing Control. It is possibly a 5pf/5pf
cap that is mounted on a rectangular ceramic base with 4-screws.
As far as I can tell (with the schematics that I have) it is in
the following radios:

National
NC2-40(A,B,C,CS,D), NC-200, NC-173, NC-183(+D),
NHU(-B,20,20B), HRO-7, NBS-3, and possibly many more radios.

Please look through your parts bins and let me know if you
have one available.

Thanks for your time,

John D.

There is a fuse on the back panel. The RS-20 is not really a 20A. continuos PS, it is more like a 15A. continuos, and even at that, the unit will get very hot.
It's likely that you burned the bridge rectifier unit, or the "pass-transistors", either way, it's not worth the cost of repair, toss it in the "junk" pile, and buy a better PS, rated at 20A. or more continuos.
I use a MFJ "Mity-Lite" switcher PS, rated at 22A. cont. and it never gives me any trouble, has a built-in fan, and never gets hot. At $140, it's a great PS.

:

Yes, you could. It is called autopatch. But
you must have control at all times. One of
our local repeats has it. Not only call we
call out but people can make calls to us (though
somewhat under limits).

CSC makes an autopatch as do others.

The best place to ask such questions in Rec.Radio.Amateur.Equipment
General ham questions can be asked at Rec.Radio.Amateur.Misc
And questions on policy at Rec.Radio.Amateur.Policy

tube design has not advanced like solid state..
i'll bet none of the ham dx or ontest winners use a tube rx..
just like fuel injection replaced carburetors, solid state has replaced
hollow state..
if i'm wrong i sure would like to know..
but for your own satisfaction you can take the best tube rx you can find
such as a Drake R4C or Collins 75S3C or any other tube rx and put it up
against a Rx in a ham xcvr such as an IC 765 or Kenwood 940 and you'll have
the answer..
tubes like buggy whips and carburetors served their purpose and except for
very unique cases are of historical interest..
just as the best mechanical watch that costs thousands can't compare to a $5
quartz in keeping time..
but it has snob appeal, the rolex not the timex...
good luck
hank
good luck..

You will have to find a way to attach the positive lead to the battery. As close to the connection point as you can be sure to put a fuse that will handle the radio. If possiable don't use one of the small glass 3AG type fuses but use a bigger one with a large contacting surface.

I like to ground the rig to the frame. Several reasons. The best one for me is that if the ground lead of the battery fails you will not be trying to carry the cars electrical circuit it the radios ground lead. If you do run the negative lead to the battery be sure to put a fuse in that lead also.

I like to have the radio come on with the car so I usually use a relay to do this with. Run the battery wire to a heavy duty relay then to the rig. Find a wire in the car that comes on when I cut on the inition switch to activate the relay coil. Lots of people say this is not a good idea as there are lots of surges and such when a car is started but I have been doing this for 30 years and never lost a mobile rig.

All the rigs I use in a car have heavy duty plugs on the battery leads so that I can go to another car if needed or if I want to bring it in the house for some reason. Or if I want to take one rig out and install another. You might even want to put two plugs on the battery wires in the car so you can install another piece of gear at a later time. I don't usually run the 220 mhz rig in the car but I have at times wanted to and the extra power connector comes in handy.

The usable sensitivity 'floor' was reached probably back in the 1940s.
As for selectivity, yes, the 'digital bandwidth' designs defintely offer specs in selectivity that were not possible in the tube era. The question remains as to how much of the improvement is actually usable.
Much of the solid-state gadgetry finds new limitations in regard to synthesizer garbage and strong signal handling capability.
It makes it real different to compare...there were high-end tube receivers and there were junk tube receivers.
If you were to take a R-390 and put it side-by-side with say a RX-340 (or plug in your favorite modern high-end rig) I think you would find the R-390 able to pull-in and slice out weak crowded signals just as well...and each would probably have situations where circumstances gave an edge to one above the other.
On the cheap end of the scale, a simple little DX-375 will run rings around any equivalent low-end tube receiver.
The worst of the whole lot were some of the early solid-state designs of the early 70s.

All of the top of the line units are good, whether they are solid state of tube units. I've had several of the tube jobs, and my all time favorite is the Collins 51J series of receivers. I had a 51S-1 for awhile, and it wasn't a bad receiver. Its shortcomings were lack of preselection below 2MHz, and a problematic bandswitch. Of course, mine came from the labs at Rockwell, so this unit had quite a bit of wear, but 51J series of receivers were also used in those labs, and they held up much better. As far as sensitivity, as long as you have an 8 to 10dB noise figure, you are doing ok.

good points

your local Motorola 2-way shop has a relay (part # 59-813674, I think) that will switch 30 amps with no sweat.

go to a good electrical supply house and pick up a bakelite NON-30 fuse holder; mount it as close to the + terminal of the battery as possible.

its big and clunky but has lots of contact area, is easy to clean, and the fuses are a buck a piece, less if you buy a box of 10.

we used to use those relays and fuse blocks by the hundreds when installing in police cars.....for the lights, gun mounts, everything. the coil draws under an amp, IIRC.

If you talk to some of the folks at Rockwell-Collins, the favorite all time receivers are the HF8050 series, and the 851S-1, which is an HF8050 with an optical encoder for tuning, instead of those thumbwheel switches. I picked up several of those 8050s at Rockwell's surplus sale for 5 dollars each, although they were incomplete. Before I moved back to Chicago, I let one of the old timers back in Iowa have them, and he was able to piece one or two complete units together. I had an HF2050 for awhile, and I do have a Racal 6790/GM in my collection. While they are nice to have, they are BIG. When I can build a receiver for aroung 150 dollars that has the same type of performance as these giants, I figured, "why bother". Probably my favorite receivers of today are the AOR7030, the Icom R75, the Palstar R30, and the Yaesu FRG100. They do fine, for household listening. Now, if you were going to use them in a shipboard installation, with several co-located transmitters.....well, that is quite a different story. I used to once look at the ads, where one manufacturer would say "mine is better than the others", or "Yaesu did it again!" I made sensitivity measurements on these different receivers, and the MDS would range from .07uV to .1uV or so. These are good figures! As far as selectivity, the Palstar R30, with its CFJ series of 11 element filters, the Icom R75, and the AOR7030 are pretty much in the same league. As far as overload rejection, these units are similar. One receiver I didn't care for was the AOR3030. I can't believe that company had the nerve to charge over 800 dollars for that unit. As it comes out of the box, it has the worst 2nd order IM rejection that I have ever seen. In order to make the 3030 acceptable, you need to change the switching diodes in the front end, the AGC diodes, and the I.F. filter switching diodes. After you do these mods,the 3030 is pretty good. Also, the sensitivity is pretty flat over the tuning range.
One final note; if any of you have purchased the Icom R75, feel free to e-mail me directly, and I will be glad to inform you on how to properly remove that MW attenuator. Simply jumpering that CP pair of pads does not remove it; you still have the shunt elements remaining. Thanks for taking the time to read this post folks; this is a great group, and there are some pretty sharp folks on it!

Hi Guys;
I have only had a few queries but no takers so I've decided to make the price more tempting :-)
This rig is very much restorable if not for the parts alone!
Remember the price is PPD!
Tr-4C technicians special or parts.
it is complete except:
1- 1ea tubes are missing, 6AQ5, 6EJ7, 12AX7
2- the Larger of the two relays that are under the chassis is missing!
3- there are 5 xtal sockets right under the meters, only 2 xtals are present, the 35.5 & the 21.5, I think originally there were 4 or 5!
4- Most original cabinet screws are missing but enough to hold it together.
5- The top cover is "crumpled" right at the front, on top. The bottom is fine, all correct plastic feet.
6- Back has Vibro identification, seen in picture.
7- Front Panel is Excellent Plus!
Check the pictures please as I am selling this for Repair or Parts.
Well worth it in parts alone for $115.00 ppd Conus!

I have used an Astron RS-35M for 14 years, with the supply on 24/7 most of the time, with no problems whatsoever. It powers a 100-watt HF rig, a QRP rig, and various accessories. It's somewhat heavy and bulky, so I use a switching supply when I travel, but it's great for home use.

I modeled a switching supply which should be easy to build. Take a look at the application notes for the LM3524 pulse width modulator on the Nat Semi webiste (the "step up" configuration). You would 1/2 wave rectify the HV output of the existing transformer, and feed this as the DC input to the choke. A HexFET could be used to pump the inductor. I used a 10kHz frequency and 30% duty cycle and the output was a neat 200VDC. The inductor is 1mH and filter capacitor 200uF. You could fit all the above into about 1/2 the space of a 5U4G. The LM3524 will operate from a single supply which you should be able to pull off pretty easily. The low switching frequency means that you won't generate a lot of QRM.

Looks like you have created some interesting comments so far. My 2 cents worth is that I have been using
both tube and solid state rigs for many years. I like both. The newer rigs have many ways of elimating noise
and seperation of stations that are very close together. For just regular short wave listening they both are
equal in many ways and both very enjoyable to use. The major differences that I see is that the newer solid
state rigs just will not keep my ham shack as nice and warm doing the winter months as the tube units will. In
the other case, the solid state rigs help to keep my ham shack cool doing the summer months. So I guess the
real answer is to have both and instead of calling them the tube unit or sold state unit, we as hams should relabel
them to being our summer or winter rigs. I for some reason, still enjoy listening to the shortwave broadcast over
my tube units more than I do my newer rigs. The old tube units just don't have birdie effects when tuning the bands so
if you here something on a tube unit it is usually a station or some nose coming thru the antenna, but not noise generated by
the rig itself. On the tube units, if a tube goes out, easy replace, if one can be found, on the solid state unit, it most likely will
have to be sent back to the factory due to specialize compentents except in a few cases. I have tube units that are at least over
40 years old and working about as good as when they were new and also have some sold state shortwave receivers that are around
30 years old and they too are still working. I would say that the solid state units will most likely out last the usefullness over the
tube units mainly due to parts not as easy to be found for the tube units. One thing for sure is that the tube unit will continue to
operate if there comes a time when there is an electromatic explosion, of course may not be anything to listen to as most of the
transmitting stations would more than likely be solid state and be effected by the explosion, but you can at least stay warm listening
to electrial noise....good luck with your question and answer. I just had to add my 2 cent worth along with some humor.

Hi Guys;
I found one of these at an Estate of a Ham Radio collector.
It is an RCA 7094, used in the Hallicrafters HT-41 RF amplifier.
It may be used in other hear but unknown to me at present.
I have no way to test it but the Filiments show good and there are NO
"THINGIES" floating around in the glass envelope.
Price is $75ppd Conus
Here is a Picture of the Actual Tube>>

Surprisingly, its easier to repair some tube units that try to located
"orphaned" ICs
This may change with time -- guess we will wait and see !

The explosion you are referring to is actually an EMP (ElectroMagnetic
Pulse). An EMP occurs with a nuclear explosion and may be created by an
asteroid or comet impacting the earth.

Solid state components can be design for "radiation hardening" and tolerance
to EMP, but as you pointed out 1) Who will be around to broadcast? 2) Who
will be around to listen?

Man, I miss the Collins surplus store !

Picked up 25 mechanical filters for $ 30 back in 1983, sold them within the year - wish I had kept them. Then there was the offer from the old store manager to take 6 brand new 7 foot Bud equipment cabinets off of his hands for $ 100 bucks if I could get them out by Friday !

I need a manual, schematic, any info I can get for the TR-79502M mobile rig, and I prefer not to pay the inflated prices on eBay or from the various manual copiers/vendors. Does anyone have one that they can sell me, or sell me a photocopy? I just need basic operation info (like how to program memories, splits, what some mysteriously marked buttons do. . .), though a schematic would be nice. Let me know what you have. Thanks.

Hello my name is Ron,

I and in need of orginals or copies of several different Regency/Wilson manuals.

Critical to my at this time is a Wilson ARU-45A power amplifier manual.

There are others I need as well, so if you have orginals to sell or can copy (at my cost) manuals please advise.

Thanks in advance for your help!!!

<rmowery@dialpoint.net> wrote:

>You will have to find a way to attach the positive lead to the battery.

Rat Shack carries some little brass thingies that work quite well for this. I forget what they're called, but they have a U-shaped cutout that you can slip under a side-post connection or between the terminal clamp halves on a top post connection. They have three spade lugs coming off of them, and usually include a couple of female connectors, but toss those into your junkbox; you'll need the yellow ones with the 12 or 10ga wire your current requirement calls for. Grab two, so you'll have one for each terminal.

Other than that, just be careful to avoid any spots where the wires might be damaged by moving parts. Special considerations may apply for your vehicle and preferences, though. For example; in my station wagon, I have a second heavy-guage pair running to just inside the tailgate, and a full set of adapters there to connect them to my rig, inverter, or an accessory outlet. That way, I can move everything to the back and set out a lawn chair for comfortable stationary operations on the field. (Also really handy for plugging in the air compressor to inflate a rear tire)

>I like to have the radio come on with the car so I usually use a relay
>to do this with.

Personally, I'm more concerned with the ability to have the rig on with the car off. That way, I don't have to leave the keys in it if I want to listen from outside.

Time was, there were two factors that "consumer" grade receivers had a severe problem overcoming, that being, 3rd order intercept point and dynamic range. The solid state circuits (mixers and amps) simply could handle the wide range of levels. I don't believe that sensitivity, per se, was an issue. A number of years back, a group of us hams at our lab did some tests with currently available radio sets; namely, Collins 75S-3C, a couple of Icoms (735?) etc., an SX-100, a RadShak, a Racal RA-17C.. you get the idea. In virtually all cases, the vintage (read: tube) sets did far better than the solid state equipment.
I contrast this with the more current crop of equipment such as my FT-1000D, and FT-990, etc. These sets do a much better job than their solid-state predecessors. The only thing I do still see is the ultimate dynamic range. One still has to use attenuators and/or resort to turning on/off RF preamps to get the full available dynamic range and to offset the inherent problems, thereof. Problem? In reality, probably not. Its just something one has to factor in. Now... if one wants to get into the Ford/Chevy-type shortwave argument, then I'll go for my R-390A, maybe my SX-28, or if I get really nostalgic, my old (but fully restored) HQ-120X..... hi hi!! 73 and pass me another 6SK7....please!

|Can modern state-of-the-art solid state designs have
|comparable if not better sensitivity and selectivity than
|state-of-the-art tube designs? (There may be other measures
|of reception performance, but sensitivity/selectivity are
|the two I know of.)

At the frequencies involved, sensitivity is almost a non-issue. Atmospheric noise is the limiting factor. On 10 meters with a directional antenna, external noise might be low enough to tax the "sensitivity" of a not so good receiver, but there is not inherent superiority of one amplifying device over another at these levels.

In spite of the foregoing, by using solid state devices rather than tubes, it is "easier" to achieve low noise amplification. If you consider even higher frequencies, then there is absolutely no contest; stick a fork in your vacuum tube, it's done.

Likewise, selectivity is not a function of the type of amplifying device used. There may be (are) issues related to impedance levels, agc characteristics, overload performance, etc. that dictate how the selectivity is achieved and these are a function of the device type. Selectivity is achieved with tuned circuits; capacitors and inductors, or their mechanical equivalents.

If you limit your receiver "figure-of-merit" to only sensitivity and selectivity, you make a mistake. In today's crowded bands, the various performance parameters dealing with overload characteristics are very important.

You may be more accurately comparing tranceivers against rcvr+xmtr. If you could make the relays click fast enough, an HT-32B/SX-115/HT-33 wouldn't embarrass itself in a contest.

> of reception performance, but sensitivity/selectivity are
> the two I know of.)

Sensitivity and selectivity are relatively easy. Even relatively early solid state designs (good ones from the 60s and early 70s) were the equal or better of tube designs. It's easy to get lots of gain with transistors, and their noise figure is lower than that of tubes, so sensitivity is no problem at all. The old tube designs mostly used low final IF frequencies and L-C filters for selectivity; the crystal filters used in good modern designs are superior in most ways.

More difficult is strong-signal handling. The aforementioned solid state receivers were terrible at it; one strong signal could make the things fold pretty badly. It was made even worse by the lack of front end selectivity, which was taken out in the interest of size and cost reduction. (Those multi-gang tuning capacitors are large and expensive.) However, the state of the art has improved since then; a good modern solid state design is at least the equal of a tube receiver in that way as well.

And, of course, modern designs give you the conveniences of synthesized tuning, memories, and so forth. On the other hand, no modern design matches the feel of the big weighted tuning knobs of the boat anchor era. So it goes.
The popular portable receivers, however, are still likely to be lacking

in strong-signal performance when compared to a good boat-anchor. High receiver dynamic range generally means receiver circuits that use a lot of power; portable receivers are optimized for low power consumption, not the ultimate in performance.

Why would the Astron not be worth the cost of repair? The 723 regulator and the pass transistors, the most likely things to fail, are inexpensive, readily available parts, and do not require any exotic construction skills to replace; the job should be well within the skills of most hams. The expensive and harder to obtain parts - the transformer, the big capacitors, and the nice solid chassis - are unlikely to need replacement.

It may be true that the RS-20 isn't up to the demands of powering the original questioner's 100W rig. But there are lots of other uses around the shack for a good power supply, such as powering VHF and UHF radios, which usually take a bit less power. So, if it were my power supply, I would certainly repair it.

Hello,

I have an ICOM 706MKIIG for sale which was purchased last spring. The rig was purchased new from AES out of Wisconsin and sat boxed for most of the summer. I purchased it knowing I wasn't going to be using it much at the time but I had the money to purchase new...so you know how that goes...turn it into a radio be fore "Life" eats it up!

The radio also comes with the ICOM HM-77A DTMF microphone for thoese auto patches when you need them.

Also comes with a bag of my own design. It has also never been used.

This is my second "new" ICOM 706 and I like them very very well. Its just life has eaten away at my operating time and its time to realize that I have other priorities... Wonderful rig, new as the used ones get...

Comes with bag, boxes(mint), manual(mint), power cord and HM-77a DTMF hand mic($120.00 alone - geez ICOM!)

Please e-mail for more pictures!

Need $775.00 Shipped to your door Cont. US.

5275. IC746, Which filters to use?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-01 17:15:06 UTC
From: "Joel H."
Message-ID: <7a03utgk6emhtoru8dqsralrjffl59b2r0@4ax.com>
Source record: 52678

I'm considering getting a new IC-746.

There are several filter options, and I was wondering which ones would be best for my use. I plan to operate primarily SSB and digital modes. I still occasionally use CW.

Since I use modes requiring different selectivity characteristics I am not sure on which of these the IF-DSP would be sufficient, not requiring specific filters.

Thanks for your help.

Joel H. (N0AOM)

5276. DT-600 RTTY Demodulator

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-01 17:21:45 UTC
From: Tony Sokol <tsokol@megsinet.net>
Message-ID: <3be18627$0$30975$1dc6e903@news.corecomm.net>
Source record: 52679

I have a DT-600 RTTY demodulator with built in power supply, loop supply with mercury relay interface, and solid state auto start relay. This unit also includes the Mainline XK-2 crystal AFSK generator. It is set up for 170 cycle shift for use with a model 28, 19, etc. Everything is built into a very high quality 3 X 9 X 12 Moduline desktop cabinet. All you need is to plug in your loop line and the AC for the RTTY unit and go. A scope output is included for tuning. All documentation is included. $100 OBO.
Note: I plan on going to the Ft. Wayne Hamfest.

A lot of good info so far.

Some other notes:

A search on the net will find online study materials
for the APCO certification test.

However there is a learning curve required before
one becomes worthy of a bullet in the head or
a lobotomy.

For your Ham install, you might learn some hands-on
from another Ham in your neighborhood. Or you
might even find a volunteer.

>"In terms of shortwave reception performance, which type of
>electronics are inherently, and in actual real-world
>receivers, better: tubes or solid-state?"

Define "Better."

Romance: Tube receivers have it. I like big heavy chassis filled with warm glowing tubes. They look neat.

Dynamic Range: You can achieve better performance if you spend equivalent inflation adjusted cash on solid state receivers compared to the tube receivers of yesteryear. One feature often overlooked is that because tubes are inherently high impedance devices, they often had some pretty effective stage to stage coupling selectivity. Thus dynamic range of tube gear is good, not because the active device is good, but because the tuned circuits from stage to stage were good. Modern wide-band solid state gear can better the performance of the tube gear with less distortion and no tuning adjustments are needed.

Audio: Tube audio amplifiers have a sound all of their own. This is because when they distort, they do so in a pleasant way that is actually sought out by musicians. Modern solid state gear often lacks decent audio amplifiers because they're usually afterthoughts. Some solid state radios are trying hard to rectify this image. Grundig's YB-400 design is one such example, but they have a long way to go...

Sensitivity: Solid state gear can have a lower noise than a tube front end. Not that this matters much on SW...

Stability: Tube gear is not nearly as stable as today's high tech solid state receivers.

Frequency coverage: With solid state gear, just tune right to the frequency and there it is. With Tube gear you may need to change a band module or re-peak a front end somewhere...

As you can see, there are positive and negative aspects to this argument. I could go on like this and so can many others. Define what "Better" means and then you can make up your own mind.

There is no inherent performance difference, except in
the minds (if that's the right word) of a certain circle
of incurable luddites who never quite figured out the 20th
century, and are terrified of the 21st.

The problem with such a comparison is that you're comparing
apples and oranges. A good tube radio is a good radio indeed.
As is a good solid state radio. The solid state radio
benefits from several decades of additional development,
whereas tube radio performance peaked in the 1950s. If any
performance difference is to be had, it is on the side of
solid state - and please spare me the garbage about "warm
tube sound" and similar nonsense. I don't care if my radios
glow in the dark. I care how well they work.

The problem comes when you start comparing specific models.
The best receiver in my home is a Collins 51J-4, which does
indeed run rings around my Realistic DX-394. However, the
Collins cost as much as a car when it was new. If you were
to compare a solid state receiver that cost as much as a
car *now*, it would blow the Collins away in every measurement.

You can get very good radios now. Rather than misguided
self-indulgent nostalgic nonsense, why not use one and listen?

I don't see any reality in this argument. Plus a lot of this circuitry has to do with non-rf sections of the receiver.

And nothing like those mechanical filters!

...and from what I have seen most modern receivers have lousy specs.
They would rather mention the number of memory channels than
IMD/overload performance. Perhaps they don't mention what really
matters because they are lousy? I would rather have a well designed
clean tube design than a typical transistor receiver. Just because
you can receive from DC to X-Rays with a built in Pentium IV doesn't
make it a good radio! One of the best receivers ever built was the
R390, all tubes, and was used by the CIA up into the '80s (in fact,
won't suprise me if they still use them).

As far as those microchips are concerned, they generate spurs and
other squirrelys.

My first attack would be on the 'calibrate' pot -- since the rig is
so 'mature'. The pot could be internally fouled with grim: smoker's
tar, environmental dust, gas, and smoke, usw.
Clean and/or replace the pot.
If this is the case, other pots will probably have the same 'disease'.

I agree. The parts are cheap, certainly fix it and sell to recoup some of the cost of buying a new power supply. Those Astron's have current and voltage foldback, and are pretty hard to damage beyond repair.

|GUESS YOU NEVER SAW AN AR88---CRYSTAL FILTER
|OR THE BC348,BC312,BC318,BC324-----ALL USED XTAL FILTERS

Golly, Mark said, "Mostly used".

A BC-342 was my first radio, circa 1955. A friend talked me into trading the '342 for a '348. Big mistake on my part. I since have reacquired three BC-342s. I also once had an AR-88, several BC-348s and a Collins 75A-1. All of them used single crystals in a bridge arrangement to offer decent CW selectivity and the ability to null an interfering carrier on phone.

The skirt selectivity was abysmal, as was the ultimate rejection. The Collins crystal case leaked and I was constantly taking the crystal out and cleaning off the contaminants to get the Q back.

The crystal filters in those receivers were nothing like the modern lattice, half-lattice or monolithic crystal filters. Not even close.

This is an Azden PCS-3000 2m radio that I have laying around and
don't need. I used it for packet and don't have the mic anymore.
Even tho I have an MFJ-1270B TNC-2, it doesn't go with the radio.
I just happen to have these two things left over.

Both come with manuals.

Price: $175 obo for both, prepay, COD or PayPal

has
| > to do with non-rf sections of the receiver.
| >
| > And nothing like those mechanical filters!
|
|
| Now there's a place for argument. Compare the R390 with the R390/A. I
know
| the 390 has an additional RF amplification stage, while the 390/A has
| mechanical filters. There are afficianados of both.

A simple solution.

Then one should own both.

| To the initial question, there are so many variables to design, that it
is a
| difficult question to answer. What might be really interesting is to have
a
| contest: someone build a state-of-the-art solid state rig, and someone
else
| build one with tubes. Keep the basic radio design the same:
single-conversion
| superhet. Design them to cover 49m SWBC band. Don't need fancy bells and
| whistles, just good basic receiver performance. Stick them in the lab and
test
| them. Stick aerials on them and *really* test them.
|
| This could be fun. . .

There must be some variances in the RS 20s as mine has both current and voltage protection circuits.

Supplies which have been run for a long time suffer failures in the output transistors as the heat sink compound dries out.

The compound then acts as a thermal insulator for the output transistors.

Message-ID: <9rta04$7sr$1@hiline.shinbiro.com>
Source record: 52612

I need to find the mic pinout for a Yaesu FT-2700, or if someone can point me to a schematic online, that would be great.

ALSO:

I need to find at least one Isolation Transformer, can be 220V to 110V or straight 220 to 220 or 110 to 110... but mush be a minimum of 3KVA and 5 KVA would be better. I am in an area that uses 220V 60Hz, and no ground system. I want to use a ground system on my rigs, but the step down autotransformers they use here keep popping the GFI main to the house. (Don't ask me what they use for a ground for the GFI, cuz they don't have a ground, or even a neutral, on their electrical system here... :( )..

TIA

My beef is mostly cheap mechanical IF filters, they ping.
Making these modern day radio sound gronky.
In the case of the R-390 it had L/C IF filter's, it's a totally different
sounding radio then the A model
Perhaps both SS and tube may be a good idea:
I believe it should have tube IF with L/C filters and class A push pull
audio with notch and EQ

Frank raises a new issue (for me) that might justify a thread Subject
change.

Should we consider renewing the heat sink compound on pass
transistors, voltage regulators, RF output transistors, and other
'high' current solid state devices a routine maintenance item?

What interval?

Visual clues for dry compound?

I have experienced a power supply pass transistor failure and the
damage to the connected equipment was not pretty.

> tnx de Ken, W8LU

Absolutely! The main issue is what it looks like now. Take a few digital pictures and offer them to interested parties. Look on eBay for previous auctions to give you a sense for price. GL!

5315. Re: Yaesu VX-5R Rubber duck alternatives?

I use a Maldol AS-30 Active Hunter. Its a thin metal rod based 14"
(tip-to-tip) whip that screws directly into the stock antenna socket.
Performance seems better than the stock duck on all bands - especially
on 2 and 450. Its super flexible, light weight, is black in color so
matches VX-5R, and doesn't make the radio top heavy - its very light
weight.

I don't have a 746 so can't say for sure, but myself I would get the rig and then go from there. For SSB, it's fine as is I'm sure unless you contest or something. For PSK, it's up to you and how sharp you want it. I do fine with standard filters, but there are times where a sharp filter for SSB could come in handy. "706mk2g in my example" PSK,etc being run in the SSB mode doesn't benefit from a CW filter, so if you want better ,you need the 1.9 kc filter or better. For casual use, the rig as is will be ok. Don't forget that most of the digi software has DSP filtering built in. Of course, if you want a CW filter that would be another one you would have to get. I don't know what the capabilties of the DSP are on the 746 as far as bandwidth shaping. The 706 DSP is useless in that regard. It's only noise and auto notch. I have used outboard DSP such as chromasound on the 706 for cw and it works fairly well, but you can still get some blowby from strong nearby signals. Again, I'd try it and see what it will do. If it needs a CW filter, you can get it later. I need to get one in my 706. For SSB, I prefer stock filters for general use. I don't like tight pinchy audio. The 1.9 kc SSB filter they sell is kinda tight for my taste and I haven't bothered with it. I can always get on my 830 with it's VBT if I want narrow SSB. MK

In practice, I have noticed that the normal quality heat sink compound tends to start drying out after about 6 months. In the case of power supplies, where it's generally easy to access the regulators and pass transistors, I would change it at that interval.. if you don't run your supply at more than 1/3 to 1/2 it's capacity, you might stretch that interval to a year..

Joel,
I have owned a 746 one year and very pleased with it. Like you I am primarily interested in SSB (no digital yet). The only optional filter installed is the 1.9khz, 9mhz SSB (FL-223). This in conjunction with the TWIN PBT make it a very selectable receiver. There is also a 1.9khz, 455khz (FL-222) SSB filter available. I have held off getting this one because it is rather pricey, about $200, and the other one does the job for me. Good luck and have fun.

I fully agree, Laura.

This has been an interesting thread, but I have noticed that most
people miss the main point. They are comparing technologies, not
proper receiver designs! You can build a good receiver with either.

My main point, which nobody has responded to yet, is that companies
seem to put more emphasis into dual VFOs, memory channels, computer
interfaces, etc. when they should be putting it into good solid RF
design.

I'm a newbie (both to Ham radio and the 746), but perhaps I can pass on the consensus over on the 746 group on Yahoo. The folks there seem to think that the Fl-222 (the narrow SSB for the 455 khz slot) is much better then the 9 mhz equivalent. The problems, of course, being:
1) cost
2) only room for one 455 khz add-in filter.

Good news gained via telephone conversation with Kenwood this morning:
500 PG-4P Programming Cables for our TH-F6A Tri-Band HTs are on their
way to your dealers. Hopefully by the end of this month.

BUT - with many more than that on "backorder," please contact your
larger dealer and get on a waiting list!

The software is available at no charge online on Kenwood's Web site.
Although labelled as "Beta v0.0," it works quite well!

S:1. ADMINISTRIVIA

Q:1.1. What is an FAQ?
Q:1.2. Where can I get a copy?
Q:1.3. Where do I send feedback?

Short Answer

FAQ stands for "Frequently Asked Questions". It tries
to cover common questions/problems/issues associated
with Icom's IC-746 HF/VHF amateur radio transceiver.

The master copy is kept at:

http://groups.yahoo.com/group/IC746/files/IC746-faq.txt

Mirrored copies (after a short delay) appear at:

http://www.qsl.net/kb9sss/IC746-faq.txt
http://206.230.2.41/IC746-faq.txt
http://www.skysdaughter.com/icom746-faq

You do not need a Yahoo email account to access the
master copy, however, you will need a logon account.
Yes, that is a subtle but hopefully minor distinction.
Not everyone is willing to have a login account at Yahoo
(even if it is free), which is one of several reasons
for maintaining the mirror sites.

Also, we post the faq monthly to:

news:rec.radio.amateur.equipment

usually sometime between the 1st and the 10th.

You can post questions/comments about the FAQ to
the above newsgroup.

Long Answer

The format of this FAQ should become apparent right from
the start. Questions are grouped into related sections
and subsections, roughly in the form of an outline.
Questions start in column one with their composite
section number.

When possible/practical, there will be both a short
and long answer. The short answers will try to be
brief and to the point, typically about one paragraph.
While correct, quick, and immediate, it will often gloss
over subtleties and details. The long answers will cover
theory, alternatives, dissenting opinions, and other
supplemental material. We try not to unnecessarily
duplicate information between the answers (this one
is an example of that). Long answers may go on for
several pages.

The questions that are addressed here (as well as the
answers) come from several sources.

This FAQ was created by and is hosted by folks on a
Yahoo e-mail discussion group at:

http://groups.yahoo.com/group/IC746

www.qth.net hosts a more generalized Icom e-mail list
that covers all models, not just the IC-746. You can
lookup more information or subscribe to that list at:

http://www.qth.net/info/icom.info

A bbs style on-line discussion group can be found at:

http://vartel.com/icom746/icom746index.html

There are also the following newsgroups:

news:rec.radio.amateur.equipment
news:rec.radio.swap

Specific comments or clarifications can be sent directly
to the FAQ coordinator. "Content submissions" would be
greatly appreciated. However, general discussion/debate
over the answers is best done in a more public forum,
like one of those mentioned above.

Q:1.4. What does this abbreviation or TLA mean?

Hams use a lot of abbreviations and TLAs (Three Letter Accronyms), Toward the end of this document, is a small glossary to some of the abbreviations we use in the FAQ.

S:2. GENERAL INFO

Q:2.1. Should I buy an IC-746?
Q:2.2. What are the IC-746's features?
Q:2.3. How does the IC-746 stand up to the ______ ?

Short Answer

Yes. Try it, you'll like it.

Long Answer

This FAQ is maintained by happy, loyal, and devoted IC-746 owners. What do you really think we're going to say?

One thing nearly everyone (both loyalists and detractors) agrees upon is that you should make every effort to try out a rig before purchasing it.

For features, check out the IC-746 specifications from brochures available at your local amateur radio equipment store, on-line documents at various vendor sites, or directly from Icom's WWW site at:

http://www.icomamerica.com/

Most of the 746's problems or faults show up either in this FAQ (eventually) or in the archives at:

http://groups.yahoo.com/group/IC746

Probably the most objective, quantitative comparisons you will find are the QST product reviews (freely available to ARRL members):

http://www.arrl.org/members-only/prodrev/

Simpler, more limited, comparison charts are available on the Amateur Electronic Supply WWW site at:

http://www.aesham.com/compare/comp_hf.html

User written reviews can be both more personal and more detailed. They can also be more biased. You can find plenty of them at:

http://www.eham.net/reviews

This topic has come up several times on Yahoo's IC746 discussion group. One of the more interesting threads along these lines starts with message 1012 and ends with message 1028. I'm told that message 1023 is particularly good. Another good thread starts with 1049 and ends with 1077.

http://groups.yahoo.com/group/IC746/message/1012
http://groups.yahoo.com/group/IC746/message/1023

Q:2.4. Where can I buy/sell a used IC-746?

Usually when someone asks this on the internet, they are looking for an on-line swap page. There are, of course, plenty of other options. Most dealers have used/demo equipment. Hamfests are a traditional favorite, as are "swap nets" on HF.

That said; the two largest forums on the internet for amateur radio gear are the USENET newsgroup

news:rec.radio.swap

and the infamous eBay auction site.

http://www.ebay.com

"Amateur Radio Trader" is both a magazine and a WWW site devoted to amateur radio classifieds:

http://www.amradiotrader.com

After those, you have your choice of dozens of dedicated swap sites on the net. A few of them are:

http://www.arrl.org/RadiosOnline/
http://www.qrz.com/forum/
http://www.eham.net/classifieds/
http://www.k1dwu.net/hamtrader/

AC6V maintains an entire list of swap pages as part of his excellent ham links/resource site.

http://www.ac6v.com/swap.htm

Q:2.5. How much is a used IC-746 worth?

Unlike used cars, there is no official "blue book" for ham equipment. Only YOU can decide this.

Your best bet is to peruse the archives for

news:rec.radio.swap

over the past 6 months or so.

You might also check out one of the following sites

Electronic Boneyard Prices:
http://www.geocities.com/CapeCanaveral/Hall/8701/ham/boneyard.htm

E-Bay prices:
http://aade.com/hampedia/prices.htm

Virtual Hamfest - Recent Prices:
http://www.vhamfest.com/prices.html

Good luck.

Q:2.6. Is there a dedicated HF net for the IC-746?

There is as of October 2001 (there didn't use to be).
It convenes near 14.310 Mhz SSb (20m) on Sunday evenings
at 9:00pm Eastern time (6:00pm Pacific). The folks
that run it shift it along with Daylight Savings time,
so the start times shifts between 0100 UTC and 0200
UTC on Monday accordingly.

There are also two HF nets devoted to Icom rigs in
general. They meet Sundays, on or about 14.317 Mhz,
at 1700 UTC and 2200 UTC.

Q:2.7. Is there an electronic copy of the IC-746 operators manual?
Q:2.8. Is there an electronic copy of the IC-746 service manual?

No such copies currently exist, although they would
quickly become popular if they did. As of May 2001,
Icom had no plans for creating either. Additionally,
Icom considers any such external productions to be a
violation of their copyright. Ray (the product manager
at the 2001 Hamvention) was very firm on this.

It's interesting to note that PDF versions of the
operator's manuals for rigs like the 718 and 756
are available on Icom's WWW site, but not for the 746.

Hard copies of both are available through any Icom
retailer as well as through the W7FG Vintage Manual
WWW site at:

http://www.w7fg.com/

Q:2.9. What is the IC-7400?
Q:2.10. Is there an IC-746-Pro or IC-746-Mk-II?

Too make a long story short, as of September 2001, the IC-7400 appears to be a successor to the IC-746; sold only in Japan. Based upon Japanese-English translations of and photos from Icom's WWW site, the IC-7400 appears to be an IC-746 with several bells and whistles. Some of the rumored enhancements include:

* 51 selectable digital filter widths (tied to TPBT?)
* Sharp or Soft filtering
* Manual notch filter (replaces APF?)
* Rudimentary in-rig RTTY decoding.
* Microphone equalization (digital instead of analog)
* Digital speech compressor (instead of analog)
* Digital voice recorder

Depending upon your point of view, the IC-7400 is either an IC-746 incorporating the new 32-bit DSP from the IC-756-PRO-II, or its an IC-756-PRO-II stripped down into an IC-746 chasis. Either way, its an intriguing rig.

More information can be found at:

Icom's WWW site in Japan:

http://www.icom.co.jp/ham/products/ic-7400/

A broken-english translation is available at:

http://www.qsl.net/ab4oj/icom/ic7400/index.html

A photo of a real unit is at:

http://www.onjapan.net/2001/hamfair/aut_0006.jpg

Yahoo discussion group devoted to the IC-7400:

http://groups.yahoo.com/group/IC7400

And a nice ham-written synopsis at:

http://www.qsl.net/ab4oj/ja7ude/ic7400.html

Q:2.11. How does an IC-746s differ from an IC-746?

Japan has a 3rd Class license that is power limited (sort of like the defunct US Novice class). The IC-746s is identical to the IC-746, except that it caters to this limited operating class. It's output power is limited to 10w on HF and 20w on VHF.

Nobody has yet reported a "mod" for this rig to bring its power up.

Q:2.12. Where can I find info on other Icom rigs?
Q:2.13. Where is info on the 706, 718, 756, 765, 735, ...

This FAQ is devoted to the IC-746. Some of the generic
information might be applicable to other Icom rigs,
but don't count on it. For general information on
other Icom rigs try:

Icom's WWW site at:

http://www.icomamerica.com/

Icom e-mail discussion group at:

http://www.qth.net

Usenet newsgroup:

news:rec.radio.amateur.equipment

The definitive collection of "mods" for all rigs is at:

http://www.mods.dk/

Yahoo Groups hosts more than 40 e-mail/WWW discussion
groups related or devoted to Icom equipment. Here are
a few of them.

http://groups.yahoo.com/group/ic706
http://groups.yahoo.com/group/ICOM706
http://groups.yahoo.com/group/IC-706Mk2G
http://groups.yahoo.com/group/IC-756PRO
http://groups.yahoo.com/group/ic756pro2

IC-765 information pages

http://www.execulink.com/~dstalk/

Last, but certainly not least, AC6V has a wealth of
links and resources on amateur radios.

S:3. Accessories

S:3.1. Power Supplies

Q:3.1.1 What power supply should I use with the IC-746?

Short Answer

Any good quality, communications grade, power supply
rated at least 20 amps or more (continuous duty) should
do just fine. However, most of us use larger supplies
(for a variety of reasons).

Popular supplies that are known to work (via testimonial):

Astron RS-35M 25/35A linear
Astron SS-30 25/30A switching
Astron SS-25 20/25A switching
MFJ 4125 22/25A switching (MightyLite)
MFJ 4225 22/25A switching
Samlex SEC-1223 23/25A switching
Kenwood PS-52 20/22A linear

Popular supplies to avoid (via testimonial):

Astron RS-20 - overloads too easily
Diamnond GZV-4000 - RF hash on 40/20m

Long Answer

This question typically arises for one of two reasons.
Either someone wants to buy a new power supply, or they
have an existing power supply that they want to use.
In both cases, the issues are: load capacity, size,
weight, electrical noise, mechanical noise, cost,
features, and appearance. Buying a new supply gives
you a lot of options; there are plenty of great supplies
out there. With an existing supply, you have no control
over these factors; you're simply looking for a "fit".

You'll want to consider the following factors.

Reviews

QST tested and reviewed many supplies in January and
September, 2000. You'll find the results informative.
ARRL members can access those and other reviews
on-line at:

http://www.arrl.org/members-only/prodrev/pdf/pr0001.pdf

http://www.arrl.org/members-only/prodrev/pdf/pr0009.pdf

Transportability

The larger the capacity, the larger and heavier
the supply. If size and weight are critical for you,
consider a "switching" supply as they are usually less
than half the size of a "linear" supply.

Electrical Noise

All supplies generate some electrical noise. Typically
the noise from linear supplies will be in the form of

AC hum while from switching supplies the noise will be RF hash. Communications grade power supplies of either type are designed to minimize the noise, and generally cause no problem. (i.e. this is not a good place to cut corners)

"Computer" power supplies that are pressed into radio service are particularly bad when it comes to electrical noise.

Usually, the harder you push a supply (the heavier the load), the worse the noise will become.

Mechanical Noise

Many supplies have cooling fans. Sometimes, the fans are loud enough to be a noise problem themselves. Fan noise is variable from supply to supply (even within the same manufacturer and model). Likewise, hearing tolerance varies from operator to operator. Thus, it's hard to tell in advance if a specific supply will have a problem. Time may yet tell.

We do know that fans are driven by load. The closer you operate to a supply's capacity, the more the fan runs.

Also, some of the transformers used in linear supplies will generate an audible hum. The transformer itself vibrates with the AC supply. Mass seems to help here. Usually (not always) the heavier the transformer, the less the hum.

Its pretty easy to put a noisy power supply under a table, behind a cabinet, or elsewhere to cut down on the noise level. Just be careful to allow proper air flow for cooling.

Features

Most of us consider current limiting, over voltage protection, and high temperature shutdown to be mandatory in a new supply.

Fuses or breakers are required for UL certification. Buy spare fuses right away; they never blow at a convenient time.

Meters are non-essential, they are luxury items. They make the supply bigger and more expensive. However, they can be very handy and even fun. Lets face it, most hams enjoy gadgets.

Adjustable output voltage is a useful feature, more useful than you might realize. Most new supplies have it

(usually internally).

Load Capacity

The size, weight, and cost of a power supply all tend to increase with its load capacity. Those factors encourage us to get the smallest supply we can. There are also factors that encourage larger supplies; such as noise, heat, accessories, etc...

The IC-746 specifications list a current drain at maximum transmit power of 20A at 13.8Vdc. Thus, the recommendation that your supply should handle 20 amps (or more) continuously.

It is possible to run the IC-746 with a smaller supply, but extreme caution and discipline are required. Very few, if any, of us recommend it for normal operation.

For example, the 20 amp maximum in the IC-746 specifications is full key-down at full power. You could just lower your RF power to help match your load to the supply. You could even run the IC-746 QRP, drawing as little as 3-4 amps on transmit.

Another factor is operating mode. Some of us have measured full-key loads as high as 21-22 amps. Normal SSB transmit at full power draws 6-15 amps. But FM, digital, and CW will generally pull 18-20 amps at full power.

Continuous vs. Intermittent Load

There are issues concerning a supply's "intermittent", "peak", or "surge" capacity. A supply might be rated for 16 amps continuous and 20 amps peak. Normally, the IC-746 runs at about 2-3 amps for receive and only hits the 20 amp maximum during transmission. Thinking of transmitting as "peak" or "intermittent" activity can lead one to think that such a supply is acceptable. It might even be. However, a problem develops when we try to define what peak or intermittent activity is.

Everyone would agree that transmitting for 3 minutes at 20 amps till the repeater time-out cuts you off is not a peak. How short a time constitutes a peak and at what duty cycle? Without some sort of specification or standard, "peak" and "intermittent" could mean just about anything. Most of us feel more comfortable with a "better safe than sorry" approach.

This dual rating system for power supplies is a great source of confusion. Specifically, you could buy a power

supply rated for 20A and have it fail under full load.
The Astron RS-20 and Pyramid PS-21 are examples of
such supplies. While both are excellent supplies,
they just can't keep up with an IC-746 under full power.

The exact definition of intermittent, peak, or surge
as used by the power supply manufacturers has not
been established.

(Some of us are going to try to talk to the
supply manufacturers about this to get more
details)

To quote a tech from Samlex:

Maximum rating is surge current requirement for
starting reactive loads or short term dynamic
loading and is limited to a few seconds.

This supply is not designed for pulsing loads.

Currents beyond the maximum rating will force the
unit into current limit and the output voltage
will drop and it will no longer be regulated.

Meanwhile, MFJ said (of the MFJ-4322):

Our units will shut down at surge. At 25 amps
surge, the power supply will shut down at about
ten seconds.

So while it is theoretically possible, most people do
not use supplies rated less than 20 amps continuous.
In fact, most use substantially bigger supplies.

Bigger Supplies

Why use a bigger supply? There are several reasons.

As noted earlier, the closer you operate a supply to
its rated capacity, the greater the electrical noise,
mechanical noise, heat, etc...

Strain leads to wear-and-tear. So it can be argued
that a bigger supply should last longer.

The IC-746 is rated at 20 amps max, but loads as high as
21-22 amps have been measured. "Your mileage may vary"
definitely applies.

The continuous rating is generally based upon an
ambient air temperature of 20 C. The rating degrades
as the temperature rises, by how much, we're not sure.
Filed Day conditions will be stressful to your supply.

13.8 V times 20 A yields 276 watts. There's a tendency for some supplies to drop voltage a little when they get hot or overloaded. There's also a tendency for some radios to increase their current pull when the voltage drops. At 12 Vdc, that same 276 watts would imply 23 amps. You push the supply capacity, which drops voltage a little, which drives the rig current up, which pushes the supply further ... then BANG. You blow a fuse. (AK6R has actually seen this effect with his 756pro)

There are plenty of other devices that need DC power. You need to account for them as well.

Other and future rigs may have greater power demands (like the 756pro). Extra capacity now may avoid the need to upgrade your supply in the future.

You might well spend most of your time in a low power situation (SSB QRP) and get by with less than 5A. But, in an emergency, you and your gear may be called upon to operate in different modes, at higher power, and with heavier duty cycles. Planning ahead for the worst case usage helps prevent an untimely failure at just the wrong time.

Conclusion

So, you'll find most of us with power supplies ranging from 20 to 30 amps continuous; and some with even bigger supplies.

S:3.2. Antennas

Q:3.2.1 What antenna should I use with the IC-746?

Short Answer

Any antenna you want.

Long Answer

Seriously. ANY antenna will work with the IC-746, with the proper interfacing. People have even made contacts using dummy loads.

Antennas are probably the most uniquely individualistic aspect of any ham station. Antenna selection is a BIG topic; much too big to deal with in an FAQ (at least for this one).

The IC-746 has 50 ohm, unbalanced, coaxial RF outputs.
With the automatic ATU capable of handling SWR
mismatches of up to 3:1, you have a wide variety of
choices available to you.

There are many excellent books on the topic; the ARRL
has a couple dozen of them. A good one to start with is:

The ARRL Antenna Book

At over 800 pages (and over 1,000 antennas), you're
sure to find SOMETHING that fits your style and budget.

For more information, try hanging out on one of over
50 e-mail groups on the topic at

http://groups.yahoo.com

or visit one of the hundreds of antenna oriented WWW
sites indexed by AC6V:

http://www.ac6v.com/
http://www.ac6v.com/antprojects.htm

or follow along with the discussions on the newsgroup:

news:rec.radio.amateur.antenna

or visit the on-line antenna magazine:

http://www.antennex.com/

or, you could just put up a trusty old dipole.

Just be sure you do use an antenna. The IC-746 does not
like to transmit into an open load (no connected antenna).
It will put an undue (and possibly fatal) strain on your
output transistors.

Q:3.2.2 What range can the automatic antenna tuning unit (ATU) handle?

Officially, the automatic ATU in the IC-746 can handle SWR
mismatches of up to 3:1. In practice, many people get
even wider ranges.

Some have pointed out that, even though the internal tuner
may tune a particular antenna configuration, if there
is a high SWR, you could end up burning out the tuner.

We have at least one case (reported by KG6GLN) where the
detector diodes in an IC-746 were fried. According to
the ICOM tech, "... it could happen if you tried to
use an external antenna tuner in conjunction with the
internal tuner. "

Q:3.2.3 Will the internal ATU handle "random" wire antennas?

No.

The internal ATU can only handle an SWR mismatch of about
3:1. You'll need an external ATU.

Q:3.2.4 Are there any "tips" to using the ATU?

Yes. The ATU appears to pay attention to the reflected
power, not the SWR. [Note: we'd love someone to
analyze the schematics to confirm or deny this.]
This is evidenced by two effects.

When starting from a close match at QRP power levels,
the auto ATU doesn't always home in on the best match.
Increasing the power level and tuning again often
improves the match, which the ATU then retains when
returning to QRP power.

The converse situation can also cause trouble.
When starting from a poor match at full power, the auto
ATU sometimes can't find a match at all. In this case,
tuning at lower power allows the ATU to get a match,
which the ATU then retains when returning to high power.

If one end of a band consistently gives you trouble
while the other end tunes easily, then you may still
be able to coax the ATU into matching the antenna.
Start in the portion of the band where the ATU works
and tune there. Then, move your way across the band
in increments (maybe 25Khz at a time), tuning as you
go until you reach the desired portion.

Q:3.2.5 Can I use the internal ATU along with an external ATU?

Maybe. Theory says yes, but Icom says no. The results
are mixed. Use at your own risk.

Many people use an external ATU along with their IC-746.
Usually, they leave the external ATU switched to "bypass"
and let the internal ATU do its thing. For troublesome
bands/antennas, they turn off the internal ATU and
engage the external one.

Others use an external ATU to match their antenna to
the middle of the desired band and let the internal ATU
handle the rest. In theory, the ATU doesn't actually
care what's hooked up to it; it simply tries to match
up to the impedance it sees.

In most cases, the above approaches seem to work fine.
Many hams have been applying both for years with no
problems.

However, some IC-746's have had their ATUs go out from
fried detector diodes and driver transistors. On many
repairs, Icom has blamed the failure upon external
tuners. One ham was told that external tuners can
cause problems even when they are switched to "bypass".

Nobody has been able to adequately explain why an
external tuner would cause such damage, particularly
when bypassed. Some speculate that tuning with low
power is safer than tuning with high power (if nothing
else, its at least more polite).

We need more information on this, but at least you've
been warned.

Q:3.2.6 Does the internal ATU work on receive?

Yes. The internal ATU is enabled while receiving.
Of course, it can only "match" while transmitting.

It's unclear if the internal ATU acts as an additional
preselector when enabled.

Q:3.2.7 How do I use a "beverage" antenna?
Q:3.2.8 How do I use different antennas for receive vs transmit?

As previously stated, nearly ANY antenna can be used
with the IC-746, provided it can be matched to the
746's 50 ohm, unbalanced antenna terminals. However,
there is more to using a "beverage" antenna than just
impedance matching.

Beverage antennas tend to sacrifice gain in order to
improve their signal to noise ratio. So, while they
are good for receiving, they are poor for transmitting.
Therefore, you would typically use a separate antenna
for transmitting.

While not convenient, the IC-746 can be configured to
use one of its antenna ports for transmitting and the
other for receiving. Run the rig in split mode with
both VFOs on the same frequency, but have VFO A use
antenna 1 and VFO B use antenna 2.

A more traditional approach (albeit, more work) is to
take the HF transmit signal from one of the accessory
ports activate a coaxial relay (via a driver transistor)

to switch between antennas. This is the same basic setup
you would use to control an external amplifier.

S:3.3. Microphones

Q:3.3.1 What is the best microphone to use with the IC-746?

In theory, your favorite microphone is the best choice,
provided you hook it up and adjust it properly.
Its basically just a matter of personal preference.

The confusion lies in the definition of "best".
Most users generally agree that the stock hand mic is
generally adequate for general use, but is not "best"
or "optimal" for any specific use. You know the tale;
jack of all trades, master of none.

If you want better transmit fidelity (or even broadcast
quality sound), then you'll want a full range microphone,
possibly with a dynamic element. Icom's own SM-20
gets good reviews for this application, as does Heil
Goldline microphones. Other microphones will also work;
these just happen to be the most popular.

Many operators have found that the inexpensive studio
microphones from Radio Shack work astonishingly well.
Yielding 90% of the performance at 10% of the price
makes this a viable, budget conscious, choice. It
also shows just how poor the stock mic is.

If you're after more "punch" for DXing or contesting,
then you'll want to look into one of the Heil DX
style microphones. They're frequency responses have
been tailored to accentuate the portions of the voice
spectrum that most contribute to understandability.
Their great performance have made them very popular.

For those of you who "want it all", Heil even makes
a microphone that switches both ways, literally.
It has two pick-up elements in the same mic, so you
can change between ragchewing and DXing punch at the
flick of a switch.

Who says you can't have your cake and eat it too?

Q:3.3.2 Can I use a dynamic/studio microphone with the IC-746?

Yes, but only if properly wired.

Icom uses electret elements and incorporate preamps right into their hand mics. The DC power is fed directly from the rig through the mic cable. When using a dynamic microphone, be sure you have a capacitor (value not critical - maybe 0.1uf to 4.7uf) in the circuit to block the DC supply voltage

Depending upon the microphone, you may have to use a hefty amount of mic gain (and possibly compression as well) to make up for the lack of the handset pre-amp.

Q:3.3.3 Can I use a Heil microphone with the IC-746?

Yes, most Heil microphones work well with the IC-746. Bob does this himself.

As with any dynamic microphone, be sure you have a DC blocking capacitor in the circuit to isolate the mic element from the DC supply voltage Heil's pre-wired mic harnesses are perfect for this.

A notable exception is the HS-706 which (as the sales literature clearly states) ONLY works on the IC-706 series.

Q:3.3.4 How do I adjust the IC-746 for a Heil headset?

In theory, the IC-746 has enough microphone gain to use an unaided Heil microphone. Heil's May, 2000, newsletter discusses this topic, see:

http://www.heilsound.com/newslettermay00.htm

In short, you use moderate mic gain (50-75%, 12-3 o'clock position) along with moderate compression (8-10db, 12-1 o'clock position) for the best results.

Q:3.3.5 Do I need a pre-amp to use a Heil microphone?

While the above procedure works for most rigs, it does not seem to work for everyone. For the few that still have gain problems, adding the Heil HMP microphone pre-amp should work.

Some speculate that the differing mic gain requirements are due to different versions of the IC-746, or simply due to widely varying component tolerences. Nobody has collected enough information yet to nail this issue down.

DO NOT use the HMP pre-amp unless you're sure you
need it. Too much gain will distort your transmitted
audio; with all the usual detriments (hard to copy,
splatter, etc...)

If you decide you need a pre-amp but want to build it
instead of buying it, then check out:

"Build a low cost Boost Microphone"
QST, Aug, 1989

along with the Icom specific mods available (DC blocking
capacitor, etc...) from KK5DR (Matt Erickson) at:

mailto:kk5dr@ev1.net

Q:3.3.6 What are the pin-outs on the microphone connector?

Here thing:

1 - mic input
2 - +8V DC Output
3 - freq up/down
4 - Main readout squelch switch
5 - PTT
6 - GND (PTT)
7 - GND (MIC)
8 - AF Out (varies with [AF]) (center pin)

S:3.4. Keyers

Q:3.4.1 Can I hook up my straight key to the front "Elec Key" Jack?
Q:3.4.2 Can I connect my own Electronic Keyer to the IC-746?
Q:3.4.3 How do I wire up my paddles for use with the internal keyer?

Short Answer

Yes, virtually any type of key/keyer can be connected
to the IC-746 via either the front "Elec Key" jack
or the back key jack. However, the two jacks require
different wiring, and only the front jack will give
access to the internal electronic keyer.

The front "Elec Key" jack on the radio accepts a
3-conductor 1/4 inch stereo phone plug and can be wired
for use with anything. The back "key" jack accepts a
2-conductor 1/4 inch mono phone plug and can be wired
for use with either a straight key or an external keyer,
but not for the internal keyer.

See page 68 in the operator's manual for wiring details
and pages 23 and 27 for the programming details.

Long Answer

FOR A STAIGHT KEY OR EXTERNAL KEYER:

For a diagram on how to wire the stereo plug see page 68
of the operating manual. For a straight Key or keyer,
wire only the tip and the Sleeve, and leave the ring
as No-Connect.

tip ring sleeve
oooo ====]]]]]]} ---------> 2 cond wire to key/keyer
(+) (nc) (-)

The back "key" jack is a mono 1/4 inch phone plug and
is easy to wire.

When using the front Jack, You also have to set the
radio to recognize that the ring is not used. To set
the radio, You do have to go to the "key", "set"
menu and tell it you will be using a straight key.
See Page 23 and page 27 in the operation manual.
While in CW mode press KEY(F4), then press SET(F5),
Press the down arrow(F2) until you reach the sixth menu
(KEYER TYPE), Use the Main tuning knob to set the type
of keyer to "Straight Key".

TO USE THE BUILT IN ELECTRONIC KEYER WITH PADDLES:

Wire the 3cond Stereo plug (use the front jack) so
that the "Dit" is the tip, the "Dash" is the ring and
the sleeve is common(-). (You can also wire up a "bug"
this way (without electronic keyer))

oooo ====]]]]]]} ---------> 3 cond wire to paddles
(dit) (dash) (-)

To set the radio to use the internal electronic keyer,
You do have to go to the "key", "set" menu and tell
it you will be using paddles. See Page 23 and page
27 in the operation manual. While in CW mode press
KEY(F4), then press SET(F5), Press the down arrow(F2)
until you reach the sixth menu (KEYER TYPE), Use the
Main tuning knob to set the type of keyer to "Elec Key".
(or "bug Key" to use the bug without electronic keyer)

Q:3.4.4 Can I use the internal and external keyers at the same time?

Sure ... you can have an iambic keyer plugged into
the front, and a straight or external electronic
keyer plugged into the back. You can then use either

interchangeably.

We don't yet know of anyone brave enough (let alone
capable) to actually use both keys SIMULTANEOUSLY.
Would such an person be a "two fisted" operator? 8)

S:4. IF Filters

Q:4.1 How many optional IF filters can I install into the IC-746?

There are two (2) slots for optional filters in the 9Mhz IF,
and one (1) slot for an optional filter in the 455Khz IF.

Q:4.2 What optional IF filters are available for the IC-746?

Available filters for the 9Mhz IF include:

Icom FL-101 250 hz (CW narrow)
Icom FL-232 350 hz (RTTY, CW narrow)
Icom FL-100 500 hz (CW/RTTY narrow)
Icom FL-223 1.900 Khz (SSB narrow)
Icom FL-103 2.800 Khz (SSB wide)
Inrad 121 250 hz (CW)
Inrad 111 400 hz (CW)
Inrad 320 1.800 Khz (SSB)
Inrad 110 2.100 Khz (SSB)
Inrad 123 2.800 Khz (SSB wide)

Available filters for the 455Khz IF include:

Icom FL-53A 250 hz (CW narrow)
Icom FL-52A 500 hz (CW/RTTY narrow)
Icom FL-222 1.800 Khz (SSB narrow)
Icom FL-96 2.800 Khz (SSB wide)
Icom FL-257 3.300 Khz (SSB wide)
Inrad 306 125 hz (CW) (might not fit)
Inrad 122 250 hz (CW)
Inrad 116 400 hz (CW)
Inrad 322 1.800 Khz (SSB)
Inrad 314 2.100 Khz (SSB)
Inrad 109 2.400 Khz (SSB)
Inrad 124 2.800 Khz (SSB wide)

(The Inrad 306 is listed on their WWW site,
and is electrically compatible, but might
not fit in the available socket.)

While not an optional filter, W2ENY has a kit to modify
the IC-746 by replacing either the stock 9Khz or 15Khz

wide internal filters with a 6Khz wide filter. See the
"mod" question of the FAQ for more details.

Q:4.3 Which optional IF filters should I buy?

Better to ask, "Why would I even need filters?".

Quite possibly, you'll won't need any optional
filters. Use the Twin PassBand Tuning (TPBT) to
dynamically adjust your IF bandwidth first. Properly
used, TPBT can give you nearly any bandwidth you want.
You may decide that you don't need any anything else.

There are over a thousand (1,429) possible combinations
of optional filters. Most of them will make sense
(i.e. be useful) to someone, somewhere. As it is a
matter of style and situation, ultimately, the choice
will be up to you.

We've broken up this issue into several questions, each
targeting a more specific issue or problem. Short of
writing a book, it is the only hope of providing any
useful answers.

Q:4.4 What is an IF filter's "bandwidth"?
Q:4.5 What is an IF filter's "shape factor"?

Also called "passband", a filter's bandwidth is a
measure of how wide a signal will pass thru the filter.
For IF filters, this is typically measured as the span
between the filter's -6db points. (Some folks measure
bandwidth at the -3db points. Pay careful attention
to the specifications when comparing filters)

"Shape factor" tries to represent steepness of the
filter's attenuation curve. Typically defined as
the ratio of the -60db passband to the -6db passband
(bandwidth). The perfect shape factor of 1.0 is
unobtainable. Shape factors of 2.0 or less are
considered excellent.

This is one of those situations where a picture is worth
a thousand words. A good look at the spectral response
curve of a typical filter will make these terms clearer.

Inrad publishes basic performance curves of most of
their filters on-line. An example of a typical curve is:

http://www.qth.com/INRAD/graphs/116.gif

Several companies have good on-line treatments describing
basic filter characteristics, complete with diagrams.

Corning Frequency Control has a very concise page styled
in a glossary format at:

http://www.ofc.com/filters/definitions.html

Vectron International also has a nice on-line treatment
of filter characteristics at:

http://www.vectron.com/products/xtal/filter.htm#definition

The folks at Piezo Technology Inc. describe filter
characteristics with attenuation curves.

http://www.piezotech.com/filter/gen_desc.html#att

Q:4.6 Why do filter "bandwidth" or "shape factor" matter?

Narrower bandwidths reject more noise and improve
sensitivity. Wider bandwidths provide better fidelity.

Narrower bandwidths also reduce the number of
simultaneous signals the rig can "hear". This reduces
the AGC pumping action caused by nearby signals,
particularly important for CW and digital modes.

Smaller (tighter) shape factors reject more noise and
improve selectivity. Larger (wider) shape factors
generate fewer problems/complaints with fidelity or
ringing.

Q:4.7 What is considered to be a narrow filter?

In the context of (and for the purposes of) this
FAQ, a narrow filter is any filter that has a smaller
bandwidth than the stock 2.4Khz wide filters. However,
most texts will describe a filter as being narrow if
its bandwidth is smaller than that of the desired signal.

Q:4.8 What are narrow IF filters used for?

Usually, narrow filters are used to reject unwanted
signals or noise. The narrower the bandwidth, the less
noise there will be and the better the sensitivity.
You can lose part of the desired signal in the process,
but that may be preferable to the interference you're
trying to reject.

Q:4.9 Can an IF filter be too narrow?

Yes, an IF filter can be too narrow, but sometimes, that can actually work to your advantage. We'll describe only a few specific situations as examples.

When the IF filter's bandwidth is less than the bandwidth of the desired signal, then part of the signal will be rejected. This degrades the fidelity (quality) of the received signal. In phone modes, the fidelity loss is often mistakenly perceived or described by operators as "distortion".

Fortunately, the inherent information redundancy of human speech allows it to be readable even when an overly narrow filter has rejected part of the desired signal. That's where our advantage comes from.

One form of interference is when a nearby signal overlaps your desired signal; as in an overcrowded band. Rejecting the interfering signal necessarily rejects part of the desired signal as well. Thus, the filter is too narrow to allow all of the desired signal to come through, but it is narrow enough to reject the interference. While the result is "distorted" in comparison to a clean signal, it is still more readable than if you left the interference there.

Another example would involve CW or PSK31. The more narrow the filter is, the less the interference and noise. In these modes, it's almost impossible for a filter to be narrow enough to actually reject part of the desired signal, as in the previous phone example. Instead, when a CW/PSK31 filter gets too narrow, you start to experience the auditory equivalent of tunnel vision. This can make it difficult to scan around for signals.

One of the handy things about TPBT is that you can narrow your effective IF filtering bandwidth at any time.

Q:4.10 What's the difference between IF filters from Inrad vs. Icom?

Inrad filters tend to have a superior shape factor to Icom's (smaller numbers are better) as well as deeper stopbands. They also tend to be cheaper.

When dealing with adjacent channel interference, the filter shape (depth and slope of the attenuation curve) is generally the prime factor. Inrad filters tend to outperform the Icom filters for this application.

For example. The stock Icom filter in the 455Khz IF has a -6db bandwidth of 2.4Khz and a -60db bandwidth of about 5Khz. That gives it a shape factor of about 2.1 The comparable filter from Inrad has a shape factor of 1.6, a -6db bandwidth of 2.4Khz and a -60db bandwidth of 3.8Khz.

This all means that the Inrad filter has a steeper attenuation curve, resulting in better extraneous signal rejection and improved selectivity.

The Inrad filters tend to have greater ultimate attenuation than the Icom counterparts. Thus, Inrad filters tend to do a better job of adjacent signal rejection than Icom's filters.

However, while the 455Khz Inrad filters are drop-in replacements for the Icom counterparts, the 9Mhz filters are not. They need a short piece of coax and a connector to wired up to the filter first. The adapting connector plugs into the filter slot, thus alleviating any mods to the radio itself. Reported assembly times range from 1-4 hours per filter, depending upon the skill and care of the installer.

Q:4.11 Which IF should I put an optional filter into?

Realistically, the performance differences between using filters in the 9Mhz IF vs the 455Khz IF are fairly small and will probably go unnoticed in normal operation.

Most people make this decision based upon slot availability and filter cost.

Q:4.12 What's different between IF filters for 9Mhz vs 455Khz?

The 455Khz IF filters tend to have superior performance characteristics while the 9Mhz IF filters tend to be less expensive.

Q:4.13 What are the 9Mhz IF filters best for?

When dealing with interference from nearby signals, the sooner you reject the unwanted signals from your RF chain, the better. So a single narrow IF filter in a 9Mhz slot may outperform a single filter in a 455Khz slot.

Q:4.14 What are the 455Khz IF filters best for?

On the other hand, filters in the 455Khz IF seem to do
a better job of eliminating background noise, possibly
due to their superior performance characteristics.

Q:4.15 How do I get the best results from TPBT?

TPBT works best when the 9Mhz and 455Khz IF filters have
closely matching bandwidths. Non-matching bandwidths
will still work, but are less intuitive, which can
cause confusion.

There are several techniques to using TPBT. The one
described below has the virtue of simplicity.

Starting with both filters in their center, detented,
position (widest effective bandwidth), tune in your
desired signal as accurately as possible.

Grasping both IF shift knobs simultaneously, adjust for
the best sound. If you have a nearby, interfering
signal, then you'll probably have the best results
shifting your bandpass away from it.

Now, adjust just the 455Khz IF shift (the inner knob)
in the opposite direction for the best sound.

Q:4.16 How do I configure the IC-746 to use an optional filter?

After you've installed a filter, you need to tell
the radio about it. Using the SET menu, tell the radio
which filter you've installed (by Icom part number)
and which slot it is in. Then, hold in the FILTER
button for two seconds to bring up the filter selector.
Cycle through your available filters by mode and by
wide/narrow until everything is set up the way you want.

See the operator's manual for details.

Q:4.17 How do I configure the IC-746 to use a non-Icom filter?

You have to lie to the rig.

All of the IC-746 filter settings are on the basis of
Icom part numbers. (This is supposed to make things
easier for new operators.) Just tell the rig you've
installed the Icom crystal that most closely matches
the one you're actually using.

Lying to the rig does have a side effect.

The 746 cannot actually shift the IF filters' passbands.
Instead, the 746 shifts the LO frequencies of the 2nd
and 3rd IF stages to shift the signal back or forth,
aligning the edge of the desired signal with the computed
edge of the filter's passband.

Small lies generate small effects, like when you
tell the rig that a 2.1Khz wide filter is actually
1.9Khz wide, yielding a 100hz offset in the control.
Larger lies generate larger effects, like when you tell
the rig that a 400hz filter is actually 2.4 Khz wide,
yielding a 1,000hz offset in the PBT control.

Q:4.18 How do I use a CW filter in SSB mode to receive PSK31?

Icom took their ease of use one step further, and
programmed the rig to prevent the use of a CW filter
while in SSB mode. They didn't know about PSK31 at
that time. So again, you lie to the rig during setup,
telling it that the crystal is wider so that the rig
will allow you to select it for SSB use.

Q:4.19 Why is there only one optional 455Khz IF filter slot?

Nobody knows for sure, but the most popular speculation
is that it made the radio cheaper.

Q:4.20 Where do I install a 2nd Inrad 9Mhz IF filter?

According to K7ZL, the place Inrad tells you to put
the filter is way over on one side in a little opening
next to a fan, and that works fine. But he has found a
second location. When you have the rig opened, if you
go on a line from the 9 Mhz filters, then to the 455
Khz filters, and keep on going towards the front panel,
you will see a square metal plate on the circuit board.
He mounted his second filter on top of the metal plate,
on its side, and it seems to work fine.

S:5. Computer Control

Q:5.1 How do I wire the IC-746 up for computer control?
Q:5.2 What cables do I need?
Q:5.3 What are CT-17, OPC-478, OPC-662 all about?

The IC-746 is computer controllable through a serial interface, but it is not RS-232. This is both good and bad. Bad, because you can't just plug it straight into your computer (wrong voltages, etc...). Good, because you can control four separate rigs with the same serial line. Therefore, to connect the IC-746 to a computer requires some interfacing. Icom made three: the CT-17, OPC-478, and OPC-662.

The CT-17 is the full boat. Versatile, it will allow 4 rigs to be controlled by a single RS-232 serial line. It's also the most expensive option and requires external power.

If all you want to do is connect up a single rig, then Icom's WWW site lists the OPC-662 remote PC control cable as the official part. If you can find it, then great. Most people can't. Instead, many hams have successfully used the OPC-478 PC cloning cable. It's less than half the cost of the CT-17. However, it is very short (1 ft ?) and will require a 1/8 inch stereo to mono plug adapter for use with the IC-746.

When you buy the RS-746 remote control software from ICOM, it comes with a single rig cable (OPC-662 or OPC-478?).

W2ENY sells a complete CT-17 clone and a single rig cable. They're both more complete package than Icom's, coming with cables and software resources on a CD-ROM. They're also cheaper. You can find out more at:

http://www.geocities.com/w2eny/civ/

http://www.geocities.com/w2eny/icom_cable/

You could purchase the nearly universal rig interface, the RigBlaster, from the folks at West Mountain Radio. It does a lot more than simply computer control, and is adaptable to other manufacturers (for a price).

http://www.westmountainradio.com/

There's really not that much circuitry in "simple" interface cables, and many have homebrewed them for as little as $10. Supposedly, the November 2000 issue of QST has a suitable design (with feedback in the January 2001 issue). On-line circuit diagrams based on the QST article appear at:

http://www.ambersoft.com/Amateur_Radio/Icom_Interface.jpg

and

http://www.qsl.net/civ_commander/interface.jpg

KD6UU posted detailed schematics and instructions
on eham.net:

http://www.eham.net/articles/1588

and then wrote an excellent updated follow-up article at:

http://www.qsl.net/kd6uu/icomci.html

The actual design of the interface circuit is subject
to debate (as the above link will make clear). Several
alternative designs (along with a wealth of related
information) are available from DF4OR's WWW site at:

http://www.plicht.de/ekki/civ/

You can also purchase clones of this interface hardware
from a variety of sources:

Universal RS232 Serial Interface for Icom/Yaesu

http://www.butel.nl/icomr2/icom11.html

K1NU ICOM Computer Control Interface

http://home.att.net/~k1nu/k1nu/Products/

RTS-01 Computer Interface cable for Icom HF Radios

http://rtsars.com/othercables_template.cfm

Q:5.4 What is the control protocol for the IC-746?
Q:5.5 What is CI-V?

CI-V is the control protocol used by ICOM for remote PC
control of their equipment. The basics of the protocol
are documented in the manual. However, most people
will prefer the documentation available from DF4OR's
WWW site at:

http://www.plicht.de/ekki/civ/

or the documentation that comes shipped with W2ENY's
control cables:

http://www.geocities.com/w2eny/civ/

http://www.geocities.com/w2eny/icom_cable/

W7FG Vintage Manuals has listings in their catalog
for both the CT-17 Level Converter and for the CI-V
Communications Interface on their WWW site at:

http://www.w7fg.com/

Q:5.6 What is the CI-V address of the IC-746?

The CI-V address of the 746 is $56 (hexadecimal).

Q:5.7 What computer software is available?
Q:5.8 Where can I get computer software and upgrades?

There are several choices (compromises?) available. On one end of the spectrum, we have programs that replicate nearly all of the IC-746 controls on the computer. On the other end, there are programs that do computer assisted contact and contest logging.

There is a fairly comprehensive listing of CI-V compatible software on DF4OR's WWW site at:

http://www.plicht.de/ekki/civ/

We'll mention some of the available software options below. User reviews for some of the below software can be found at:

http://www.eham.net/reviews/

and

http://www.qrz.com/search.pl?topic=reviews

** Icom RS-746 software

Icom SELLS a program called RS-746; buying it is certainly the path of least resistance. It is available through the usual retail channels. It comes complete with both software and the necessary cabling (OPC-662?). Many people describe it as a thing of beauty. (Of course, beauty only runs skin deep.)

A description of the software can be found at:

http://www.icomamerica.com/amateur/hf/746soft.html

To quote ICOM's own support FAQ (circa May 2001):

Q: Where can I download the ICOM PC programming (or cloning) software?

A: The ICOM programming software is not freeware, and is not available for download on our Web site, or anywhere else on the Internet. It must be purchased either from an authorized Icom America dealer, or direct from ICOM. RT Systems also develops programming software for ICOM radios.

Ray (the product manager at the 2001 Hamvention) was very firm on this issue. They take a dim view of the

pirated copies available on the internet.

Last word we know of (January 2001), Icom had no plans to update/fix/enhance the RS-746 software.

** RT Systems software

OK, so Icom refers us to RT Systems at:

http://www.rtsars.com/

However, as of May 2001, RT Systems does not have a 746 control program. They told N8AVX (in February 2001) that they had no plans to do so either.

** Kingsmith Software

Kingsmith Software is developing control software for the IC-746 (RATS IC-746), but as of May 2001, it wasn't available yet. More information is available at their WWW site at:

http://www.kingsmith-software.com/

** W2ENY

W2ENY ships a CD-ROM with lots of software and documentation along with the PC to rig interface cables he sells. Many of the packages listed here are also on his disk.

http://www.geocities.com/w2eny/civ/

http://www.geocities.com/w2eny/icom_cable/

** RadioComm

Arachnophilia has several programs: RadioComm, IcomControl, and EasyTuner (among others). Check out the download section on their WWW site is at:

http://www.arachnoid.com/

** YP Log

Tony Field (VE6YP) makes a radio control and logging program called YPLOG. His WWW site is at:

http://www.nucleus.com/~field/

** TRX Manager

Some say that TRX Manager by F6DEX has more features than the original radios. More info can be found at:

http://www.trx-manager.com/

http://www.hosenose.com/trx-manager/

** XMLOG

The freeware logging software produced by W1ECT also
talks directly to the IC-746. You can learn more at
either the WWW site:

http://www.xmlog.com

or at the yahoo e-mail group site at:

http://groups.yahoo.com/group/xmlog

** TR Log

One of TR-Log's claims to fame is that it will run on
just about any PC. More details at:

http://www.qth.com/tr/

** CI-V Commander

A package that integrates well with the DxLab software
suite. More details at:

http://www.qsl.net/civ_commander/

** IRC

One of IRC's claim to fame is selectable skins.
You get to choose what you want your radio to look
like, be it IC-746, IC-706, or even a 007 spy watch.
More details at:

http://n9zle.tripod.com/

** YPlog

YPlog can control 4 rigs at a time and supports logging
and contesting.

http://www.nucleus.com/~field/

** ScanCat

Very extensive scanning support, including automatic
digital recording to your hard disk,

http://www.scancat.com/

S:6. Problems and Clarifications

Q:6.1 What's that funny rattling noise I hear when I first power on the rig?

Often, its the antenna tuning unit. The relays make
audible clicking/rattling sounds.

Q:6.2 Why doesn't the ALC meter work while adjusting the "mic gain"?

Despite what the manual says, the ALC meter only works
for SSB; not FM, CW, or RTTY. Nobody knows what (if
anything) the ALC reading means on the other modes.

Q:6.3 Why can't I program any numbers into the memory names,
the CW memory keyer, etc...?

Use the keypad to enter numbers. The dial only does
letters and punctuation.

Q:6.4 Why isn't my output power up at 100 watts?

One possibility is your DC supply voltage. As shipped,
the IC-746 really wants a full 13.5 Vdc to yield full
output power. Check the actual voltage your rig is
receiving. You may need to adjust the voltage setting
on your power supply.

If your rig isn't getting the voltage you think it
should, then check for voltage drops along the power cord
and across joints and connectors. It's possible to lose
as much as a half volt per connection. Solder joints
and use high quality connectors where possible.

12 AWG wiring is the minimum, but 10 AWG is better.

If you absolutely can't get your voltage up (for example,
total battery power), then you might consider adjusting
the power settings for RF PAs (there are 4 of them).
However, trying to run a full 100w output at the reduced
voltage will most likely degrade the quality of your
transmitted signal (clipping, IMD, etc...). Most hams
decide that the 1-2db gain doesn't justify the crumby
signal.

One last possible remedy for the low voltage problem.
You could get a DC-DC voltage converter. Such a device
accepts 12Vdc in and yields 13.8Vdc output. There's a
price. First, they tend to only be 80-90% efficient,
so a 20A draw by the IC-746 can translate to a 25-29 amp
draw by the converter. Secondly, comercial units like
the Newmar 12-12-35I DC-DC Converter can retail for more
than $900. There are homebrew versions that can handle
the low current requirements of a true QRP rig, but none

that can handle the high current demands of the IC-746.
If somebody finds/designs one, we'd like to hear about it.

Q:6.5 The backlight in my LCD has stopped working. What's wrong?

Short Answer

Its probably one of the display driver transistors on
the S-Logic board behind the display. It will have to
be replaced.

Long Answer

Unfortunately, this has become a problem for some
746's. It's not the actual 'lamp' itself, but one
of the driver transistors. The lamp is fluorescent,
and will probably never wear out. Even if it did, the
lamp isn't available as a separate part; it's part of
an assembly you need to get from Icom.

There is a DC/AC converter driving the "lamp". Check
the S-Logic board for transistors Q301, Q302, Q303,
and Q304. Q302 is the most likely culprit as it is the
voltage regulator for the dimmer function. If you have
a DC voltage on the collector which is variable by the
dimmer function on the radio, then this transistor is
probably OK. Q303 and Q304 are the next most likely
candidates. These 2 transistors are in push-pull
configuration to drive the X-former (base is 180deg
phase shift by the X-former)

Refer to pages 6-1, 9-1, 10-1, and 11-2 in the "Service
Manual" for more details.

Several folks at:

http://groups.yahoo.com/group/IC746

have successfully performed these repairs themselves.

OZ5ACI feels that the way the Q302 transistor is mounted
is a design flaw. Icom used the cooling fin of the
transistor as a soldering point, thus if it gets too
hot, the solder might melt. That slowly deteriorates
the soldering material resulting in a lost connection
and a cooked transistor. He has a feeling that future
cooked transistors can be prevented by simply unsoldering
the transistor cooling fin to lift it and lengthen the
center leg to establish connection at the cooling fins
soldering point.

AH6LE counters that if the transistor gets hot enough to melt solder (300 degrees or so), then there are other more serious problems. Most solid state devices won't survive such temperatures, thus we're seeing the result, not the cause.

OZ5ACI used an "overkill" transistor from his junk box and had to cut a bit of the cooling fin to make it fit under the shield. The original transistor (2SB1201) is not very tall and can be left at an angle so no cutting is needed (or wanted!). He says it's all fairly simple. The only trouble is that the front section of the 746 has to be taken totally apart and getting it back together with no dust behind the plastic screen is a pain. Get yourself a small can of workshop compressed air or CO2 if you can.

Of course if your 746 is still under warranty, you may want to consider going that route. Either way, contact Icom for the parts you need.

Q:6.6 Is there some way to get the Icom-746 to generate DTMF tones?

No. The IC-746 will not generate DTMF tones.

However, you have some options for generating DTMF tones yourself.

The good news is that Icom's compatibility table shows that the HM-14 DTMF hand microphone will work with the IC-746. It even comes with a handy switch to enable/disable the UP/DN buttons. Remember, you have to press the PTT switch to use the DTMF pad.

The bad news is that the HM-14 is a discontinued item, so availability is limited. Also, as K9HFX discovered, there are apparently two versions of the HM-14. The version without the scan button enable/disable switch did not work for him. More information is needed.

While not listed on Icom's compatibility charts as such, VE2MHF reports that the HM-56A also works, even the scan buttons and 14 DTMF memories. However, beware, as VE4HAY reports that the DTMF pad on the HM-56 will also work with the IC-746, but it's scan buttons will not. We have to be careful of the 'exact' model numbers.

Icom confirms that the HM-118T will work with a suitable wired adapter. There is also speculation (but no confirmation) that an HM-95 microphone might also work with a suitably wired adapter. If you succeed with such an experiment, please let us know.

KC2CJW has successfully adapted an Alinco EMS-11
microphone for use on the IC-746. You'll need
two cable-mount 8-pin microphone connectors (one
female, one male), a couple of inches (maybe a foot)
of decent multi-conductor cable, a 470 ohm resistor,
and some soldering skills. Paul can provide pin-outs
upon request.

Another option is a portable tone dialer, such as one
that you could get at any Radio Shack. Just send the
tone sequence right through the microphone. Not all
such devices give access to the 'A' - 'D' tones, but
those tones don't get used much anyway.

Some have suggested wiring a DTMF pad into a microphone
cable, much like what you would do for a TNC. However,
as yet, nobody has shared any success stories.

Q:6.7 Why don't my "band edge beeps" match the US amateur bands?

Nobody knows what (if anything) the band edge beeps
correspond to.

Q:6.8 Can I transmit all the way out to the "band edge beeps"?

Yes, you can transmit all the way out to the beeps.
The IC-746, as shipped from the factory, can transmit
outside of the amateur radio bands. This has been
tested and confirmed on several rigs via dummy loads.

Q:6.9 Can I reprogram the "band edge beeps"?

No, there is no known way to reprogram the band edge
beeps. There are no fixes or planned updates from Icom
dealing with them.

Q:6.10 Do we know anything about the "band edge beeps"?

The band edge beeps generate a lot of discussion and
speculation. As of June, 2001, the band edge beeps on
all tested rigs correspond to:

1.8 - 2.0 MHz
3.4 - 4.1 MHz
6.9 - 7.5 MHz
9.9 - 10.5 MHz
13.9 - 14.5 MHz
17.9 - 18.5 MHz

20.9 - 21.5 MHz
24.4 - 25.1 MHz
28.0 - 30.0 MHz

If you know of an UNMODIFIED rig which differs from this,
then please let us know.

While nobody has figured out what the band edge beeps
correspond to, we have been able to rule out several
possibilities.

They do not correspond to the amateur radio frequencies
in Japan. For that matter, they do not correspond to
the ham allocations in any of the IARU regions.

They are not a combination of all available amateur
radio from around the world (i.e. a minimal superset).
They are much wider than that.

As wide as the band edge beeps are, they do not encompass
all of the MARS (Military Affiliated Radio Service) or
CAP (Civil Air Patrol) frequencies. To do that still
requires a "mod".

Any other ideas or info?

Q:6.11 How I reset back to factory default settings?

While pushing in [F-INP] and [M-CL], push [POWER]
to turn power ON.

Q:6.12 What "birdies" does the IC-746 have?

"Birdies" are spurious signals internal/inherent to the
rig itself. They are normally generated by harmonics
and/or mixing products of the internal oscilators (IF,
VFO, display driver, CPU clock, etc...) that are picked
up by one of the RF/IF stages of the rig.

Birdies are usually perceived as silent carriers on
AM and FM and as steady tones on SSB and CW; sort of
like someone tuning up on that frequency. Thus the
perceived frequency of occurrance is affected by your
preferred sidetone.

Often, local noise sources can be mistaken for birdies.

True birdies tend to be consistent from rig to rig.

The following frequencies have been submitted as possible
birdies. There have not been enough correlated reports

yet to confirm these as birdies. More information and
reports are needed.

Q:6.13 How do I adjust the LCD display?

On page 66 of the 746 manual. This page discusses
how to change both the LCD contrast and the LCD
backlight.

S:7. Misc...

Q:7.1 Are there different versions of the IC-746?

Yes, there are at least two distinct versions of
the IC-746.

While most of the indications are circumstantial,
one definitive piece of evidence are the two different
procedures for modifying the transmit/receive range.

Another definitive indication are the 2m differences
between the U.S., Japanese, and European versions.
In Japan, the IC-746 has different auto-repeater offsets
and is limited to only 50w RF output. In Europe,
the IC-746 does not transmit above 146Mhz and has no
auto-repeater offsets at all. There's also a version
in Australia that is limited to 20/8 watts on 2m for
FM/AM.

There are varying reports about the necessity of a microphone pre-amp when using Heil microphones, leading some to speculate upon differences in the microphone input circuitry. K9HFX was unable to generate DTMF with an HM-14 microphone; that might be related. There isn't enough information yet to be conclusive.

Some rigs seem to have problems with the transistors that drive the LCD backlight, some do not. This might be due to a circuitry change, or a difference in assembly. The jury is still out.

The only way the issue will be resolved conclusively is for someone to organize a data collection effort to sort out these details by serial number. So far, no one has volunteered.

Q:7.2 What TX/RX "mods" are there for the IC-746?

"mod" is slang for "modification".

Most people who ask about modifying their radio are looking for ways to make the IC-746 transmit or receive additional non-amateur RF bands. The 746 already has general receive coverage from 0.5 to 60.0Mhs, so no "mod" there.

Modifying the IC-746 to transmit outside of the amateur bands is generally considered to be illegal. There are a few exceptions; like perhaps MARS/CAP, transverter usage, changes/additions to ham bands, etc..., but they can become controversial.

That said, MARS/CAP/TX/RX modifications for the IC-746 (and many other radios) can be found at:

http://www.mods.dk/

Another source for the TX/RX mods is QRZ.COM

http://www.qrz.com/download/mods-i-k/ic746.txt

Q:7.3 What other "mods" are there for the IC-746?

Not all mods are about TX/RX frequencies. Here are some of the others.

W2ENY has devised a way to replace the stock 15KHz or 9MHz IF filters for AM work with 6KHz filters.

http://www.geocities.com/w2eny/icom/filter.htm

AH6LE has modified his IC-746 to provide safe sequencing
for EME work.

http://www.ah6le.net/radiomods.html

OK2WY has a "Simple CAT / programming interface for
ICOM RIGs". Rumor has it that he has also designed an
in-board step attenuator.

http://www.qsl.net/ok2wy/projects.htm

K7YVZ has proposed a mod to the VHF section to provide
seperate transmitting and receiving antenna ports.
The details can be found at his WWW site:

http://www.qsl.net/k7yvz/746mod/

G4YTL describes the same thing at:

http://www.mods.dk/mods.php3?radio=icom&model=ic-746&selectid=1919#1919

While not technically a "mod", NI4L has outlined the
alignment procedure for increasing the RF power output
above 100 watts. Opinions differ as to how much strain
this may or may not place upon the PA transistors or
upon the internal ATU. The aligment procedure can be
found at:

http://www.mods.dk/

W2FS wrote an article for the Dec 99 QST entitled
"A Direct Frequency Entry Keypad for ICOM Transceivers".
The "Millenium QSYer" is based upon that design and
available from:

http://www.john.hansen.net/keypad.htm

Some folks have replaced the transistors that drive
the LCD backlight in an attempt to prevent overloading
and burnout. See the question devoted to LCD lamps for
more details.

Q:7.4 I'm brave; what other "mods" are there?

While several other "mods" have been discussed, to date,
we don't know of anyone brave enough to try them.

The stock 455 Khz IF filter is a 2.4 Khz wide ceramic.
The PC board is drilled and traced for a full fledged
crystal filter (either from Icom or Inrad). In theory,
replacing the cheapo ceramic filter with a superior
crystal filter should improve the rig's performance.
One source of info claims that to do this mod requires
changing 2 resistors (R701 and R704) from 10K to 3.9K

to change the impedance seen by the filter from 2K
to about 1.2-1.5K.

Likewise, it is speculated that the IC-746 has cheapo
PIN diodes in the detector circuit. Again, in theory,
replacing these with higher quality components
(preferably matched) would improve performance, in
particular, the 3rd order intercept point.

A few folks have noticed that the IC-746 is less
sensitive below 1.6Mhz. This appears to be due to an
additional attenuator being switched in to protect
the first RF amplifier from overload by broadcast
transmitters. Some theorize that removing the extra
attenuator (by simply bypassing it with a jumper) would
improve the sensitivity, while others point out that the
atmospheric noise level is too high to put any additional
sensitivity to use.

Again, we don't know of anyone willing to admit to
performing any of these modifications. If you perform
one of these (or some other esoteric "mod"), then we'd
love for you to share your results with the rest of us.

Q:7.5 Can I operate 2m on reduced power?

Sure, just turn down the RF output power control (along
the bottom front edge of the rig).

Too inconvenient? Then you could get inside and tweak
the pots that control the RF PA settings. There are 4
of them for HF, 6M, 2M and AM (R989, R991, R993, and R990
respectively). Refer to your Servive Manual for details.

Q:7.6 Where can I find plugs for the ACC connectors?

They are 7-pin DIN connectors (the old style AT keyboards
used 5-pin Din). A couple (of many) possible sources
are:

Digi-Key http://www.digikey.com/

BUX CommCo http://www.buxcommco.com/

Your local electronics store either have them or can get
suitable substitutes. For example, most Radio Shacks
have the 8-pin DINs in stock (#274-026). They are
compatible after you remove the center pin.

Q:7.7 What are the pin-outs on the ACC connectors?

Pin outs are as follows:

ACC(1)
1 RTTY (FSK)
2 GND
3 SEND (PTT)
4 MOD (audio in)
5 AF (audio out)
6 SQLS
7 13.8V
8 ALC (0 to -4VDC yields 0 - 100W)

ACC(2)
1 8V (< 10ma)
2 GND
3 SEND (PTT)
4 BAND
5 ALC (0 to -4VDC yields 0 - 100W)
6 (nc)
7 13.8V

Q:7.8 Does audio to pin 4 of ACC-1 trigger the VOX?

Pin 4 of ACC-1 does not trigger the VOX circuitry,
nor is the level of that input affected by the front
panel mic gain control.

Q:7.9 Where can I get replacement power connectors?

Short Answer

The connector you need is often called an "OEM-T"
connector. You can order Icom part number OPC-025A or
OPC-025D from any of the major ham equipment retailers
for a pre-wired cable.

Long Answer

Icom's cable compatibility chart lists the OPC-025A.
Most retailers sell the OPC-025D. Both apparently work.
The OPC-025A is rated for 20 amps, while the OPC-025D is
rated for 30 amps. Most hams prefer the beefier cables.

Rather than finding another Icom connector, many
folks put inexpensive connectors on the cables of
all their rigs and power sources. That way they can
use any rig with any supply no matter what brand.
Particularly handy for switching between mobile rigs.
Even Radio Shack has these, cheap.

One very popular connector is the Anderson PowerPole.

http://www.andersonpower.com/

which is readily available from either

http://www.dcpwr.com

http://www.powerwerx.com/

In fact, the PowerWerx folks have pre-wired, PowerPole to
OEM-T cables ranging from 1 to 10 feet long that are much
cheaper than the Icom part (less than half the cost).
You can always just snip off the PowerPole connector
if you don't want it.

Many clubs and organizations have been standardizing
on the PowerPole connectors for their high amperage
12VDC power. This makes all of their equipment
inter-compatible and interchangeable; a real plus in
an emergency. There's a good article on that subject at:

http://www.dcpwr.com/standard.html

Q:7.10 Where can I get replacement microphone connectors?

Try Radio Shack, P/N 274-025 for the plug.

Or, try The RF Connection at:

http://www.therfc.com/micconn.htm

Q:7.11 How does one improve the fidelity of a received signal?

Here are several possibilities (not in any particular order).

* Assure precise tuning

* Use a high quality external speaker or headphones

* Try to run without pre-amps or with attenuator

* Reduce the RF gain (increase AF gain to compensate)

* Set TPBT to widest bandwidth

* Use wider IF filters

* Turn off NR

* Turn off ANF

* Turn off NB

* Set AGC to SLOW

* Be sure input power is greater than or equal to 13.5 Vdc

Q:7.12 Can the IC-746 transmit at less than 5 watts?

Yes, with the help of some external circuitry.

The IC-746 isn't really designed for QRP operation
(the 2+ amp draw on receive should prove that).
The front panel control will only get you down to
about 4-5 watts. However, you can apply a voltage
to the external ALC input to get even lower. 0 to
-4Vdc input yields 0 to 100 Watts output. One ham
even uses a simple voltage divider/pot arrangement
powerd by 2 AA Batts.

K5UHF warns that there can be a minute moment of higher
power output before the external ALC level kicks in.
Not normally a problem unless you're driving input
sensitive equipment; like transverters.

Contributors + Acknowledgements

There are two kinds of contributors to this FAQ: direct and indirect.

Direct contributors have written entire passages that have been incorporated nearly verbatim. Often, they are specifically authoring something with the FAQ in mind. Also, they are individuals who have been recruited to review specific sections prior to distribution.

Indirect contributors have had their comments and input collected and assimilated from public correspondence on discussion and news groups, often without their knowledge. They were simply answering questions, offering advice, or otherwise just helping people out.

The coordinator has not tried to keep a record of who has contributed what; the book-keeping would be horrendous. All sources of information have been INVALUABLE and are APPRECIATED. Listing contributors here is a small token of thanks for their neighborly spirit and generosity. The Coordinator apologies if anyone has been missed.

Hi Don,

I could use this amp illegally on CB. Will it "talk over" other
people? Will you sell it to me? I have no license. I saw your ad in
rec.radio.cb so I assume you don't care if your ham amplifier lands in
the hands of an unlicensed CBer like me, right?

-Aaron-

I saw nothing to indicate that "Don" did either and AFAIK there is
nothing illegal about anybody *owning* such an amp. Of course the folks
at Waco weren't doing anything illegal either.

My Ham friend here in Prescott,AZ had some tube issues with an AL-80B
he bought from Burghardt. They took good care of him even though
there were several tubes involved over the course of about a year...he
says he would definitely buy from them again....

Myself I have always found Texas Towers to be best for two reasons

1. lowest price every time I check around
2. excellent service after the sale
3. great web site that is easy to navigate

5333. Help! Microphone Hum.

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-02 21:57:31 UTC
From: Frizz <kg4ivt@hotmail.spamsucks.leaveme.alone.com>
Message-ID: <fFEE7.62448$%B6.24646360@typhoon.southeast.rr.com>
Source record: 52638

I am using an unamplified, built from spare parts D104 desk mic with a Yaesu FT-290r radio. Whenever I key the mic I get a slight hum in my transmitted audio. This is not coming off of the power supply (Astron RS-20a). I keyed up the rig without a mic to make sure. I have tried placing capacitors across the mic element itself, across the ground and positive side of the mic, and grounding different parts of the mic to the chassis of the radio. None of these got rid of the hum. The mic is using a coiled and shielded cord to the radio and I have gone over all my connections several times. With the original mic, which is broken, I didn't have this problem. Any help is appreciated. This is starting to get on my nerves. Thanks!

What the hell does Waco have to do with my criticism of a guy who
includes rrcb in his "amplifier for sale" distribution list? I think
placing an amp ad in rrcb is inappropriate. So what? Everytime someone
criticizes something you do as "inappropriate", do you yell "Waco"?

Man oh man!

I have for sale an absolutely mint Kenwood TS-850SAT. I am the original non smoking owner. I have both shipping boxes, hand mic, owners manuals and unopened accessory bag. The radio is a 10 out of a 10 functionally and cosmetically. The radio includes the SO-2 TCXO unit which is a $180.00 option. This is one of the last 850's manufactured. The serial number is 80200024. This is most likely one of the finest 850's you will find. I am asking $950.00 shipped ground UPS CONUS.

5336. FS: ICOM IC_746

I have for sale an absolutely mint Icom IC-746. This radio is as new
and includes the optional UT-102 voice board. The radio is all mode and
covers HF, 2M and 6M. The radio has a built in antenna tuner. I am the
original non smoking owner. I have the original box, owners manual,
hand mic, unopened accessory bag and sales brochure.
I am asking $1,000 shipped ground UPS CONUS.

I have for sale an Icom IC-471H all mode 432MHz rig. This radio is in excellent condition and has had the cap replacement mod. I have the original box, original owners manual, a copy of the owners manual, sales brochure, hand mic and power cord. This is the high power version. The radio comes from a non smoking environment.
I am asking $475.00 shipped ground UPS CONUS.

These are great people. I have been dealing with them for years and have never had a complaint. When I have had problems with gear it was taken care of immediately and to my satisfaction.

In my opinion they are wonderful folks to do business with!

Jon -

RTTY is a demanding mode on equipment, since you are running at 100% .
You should be using an RS-35 model or larger

Astron rates all of their power supplies at continuous and ICS, which is
used
for sizing the right model for the commercial radio business.

The cost of components to fix the supply are usually less than $ 10.00

I would fix the supply and then sell it, or donate it to a new amateur who
desires
to build a 10 amp 12 volt power supply for the bench or QRP.

That is right ..the actual continuous rating for the RS20 line is only 16A. Mine failed while doing 10M FM at 100W and I was pulling right at 20A.....

Astron fixed it under warranty and now sits in the garage in the factory sealed box as an emergency backup supply....

It sounds like several people have been really lucky with the pass transistor failing open. Mine failed shorted. The output voltage rises and the SCR in the over voltage protection circuit fires. The problem is that it is connected right across the filter capacitors so the SCR can't handle the current and it opens. Now the Astron sits there and pumps over 20 volts to the rig which turned several ICs in the receiver to toast. After I repaired the Astron, I put a 20 amp fuse in line between the capacitors and the SCR and supply positive output lead. Now if the SCR fires it opens the added fuse which immediatly kills the output voltage and protects the load.

> OR THE BC348,BC312,BC318,BC324-----ALL USED XTAL FILTERS

I said "mostly". I am aware that there are tube designs with crystal filters, as well as the Collins radios with excellent mechanical filters. And there are modern solid state radios with inferior solutions such as ceramic filters. Still, the best of now is better than the best of then - the state of the art of filter design has improved. (And the worst of any era is terrible indeed.)

I also said "in most ways" advisedly. Many modern crystal filters have poor time-domain response. This makes the radios sound bad in ways that are hard to define, as well as potentially muddying high-speed data modes.

How about:

Non-military Hammarlund's HQ-180, SP-600, HQ-140X, HQ-129

> Still, the best of now is better than the best
> of then - the state of the art of filter design has improved. (And the
> worst of any era is terrible indeed.)

I disagree - I have a few of the "modern" good radios and I am NOT impressed. I have replaced many of them with the above Hammarlunds.

Solid State is wonderful for a battery powered porta-ghetto SW sound blaster... which is OK for most young people who don't know any better. Sony 2010 is good example - check out those tuning sounds!...chuff-chuff-chuff

DSP is only as good as the software in the chip (and some is pretty bad).

Tube equipment is hand assembled.

Solid state is robotically assembled on moving belt. "Techs" paid minimum wage have 10 to 20 seconds to align and checkout each unit.

I could go on and on... but many of us already KNOW all this...

> I also said "in most ways" advisedly. Many modern crystal filters have
> poor time-domain response. This makes the radios sound bad in ways that
> are hard to define, as well as potentially muddying high-speed data modes.

I'll define it - the words "cheap" and "crappy" come immediately to mind. That goes for the "Top End" equipment as well.

My HQ-120 runs rings around any Grundig or SONY SWBC RCVR I had in the past 4 years and it was made 64 years ago! I doubt if any of today's new solid state rigs will be around 64 years from now. Which is YET another reason to go tube!

I sold all my solid state stuff and went back to tubes...

Sign me...

Been there done that - got the solid state T-shirt... and gave it back.

I use a 7" long, ultra thin Comet antenna, I don't remember the letter it begins with, but it's number is 3. (HT is not available at moment to check. I think Pryme has a similar model. It is for 2M and 440 and works notably better than the original antenna on those two bands. It also performs about the same on my new Kenwood TH-F6.

I still have my original BTL-A, except that I removed it from the original base and mounted it on a hockey puck-sized chunk of steel, machined out underneath for a terminal strip and cables, and polished up and painted black to match. With a piece of non-slip material underneath, it's as stable as, well, a chunk of steel...

I love my paddle. Would never consider selling it.

Does anyone out there know how to adj. the audio detector
level on the IC-706 MKIIG?? This output is on the 13 pin ACC jack.
The manual implies that it is adjustable, but doesn't say how.
Perhaps it is in the service manual somewhere.

Thanks

Another thing about modern radios that has nothing to do with
technology but might be important to some is the fact that they all
look like bedside clock radios. Not much styling in any of the modern
stuff.

I don't know too much about HF rigs, but don't they have a fuse in the
power lead that goes to the radio to protect it?

I guess the hum is not PL tone since it's not there with no mike.
Normally, I'd be thinking the cord is flaky, bad shielding etc. But
you have checked that. Tried a different cord? I wonder about the
impedance match? A d104 is normally Hi-Z isn't it? The 290 should be a
low Z mike input set up for a dynamic or electret element. The d 104
crystal element may be prone to producing more hum on that rig. How
hot is the audio and drive to the rig? MK

Actually this was a VHF rig. However, the fuse in the radio will not protect it from over voltage or reverse polarity *unless* the radio itself has the appropriate circuitry to do that. Many rigs have a diode to protect against reverse polarity but most have nothing to protect against over voltage. The radio's internal fuse goes right after all the ICs have been toasted.

Source record: 52582

Most rigs have fuses in both power lines. But few, if any, have a crowbar circuit across the power lines to protect the rig if the input voltage goes too high. However, in defense of the rig, they power the ICs using one or more voltage regulators that can certainly handle 20vDC input. The final amplifier transistors or module usually can handle that much because it uses the raw DC input power. It's only the couple of things like audio amps, that tend to run on unregulated DC, that will end up toasted.

Even if you had a 20v crowbar in the rig, some things might still end up being destroyed just because the engineers didn't put in enough extra circuitry (which translates into additional cost) to protect against every casualty known to man (i.e. lightning).

5378. Ameritron 811H opinions needed

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-03 13:52:38 UTC
From: art burke <pianomanab@starpower.net>
Message-ID: <jkt7ut8h53s5d7qrcrou5knhouqb57n3hd@4ax.com>
Source record: 52583

Hi to All:

Am considering the Ameritron 811H amp and would like some good opinions on it:

1) I've never owned an amp and am planning on using it with the TS-830S and an Icom 746

2) Will I see a huge difference between 800 watts PEP and a larger amp's output? I don't want to buy the smaller amp if I'll be disapointed knowing that larger amp would have made a big difference.

3) I've read that you can replace the 811's with 572B tubes. Do the 572B's increase the reliability and the power output, or are the just a longer-life tube?

Thanks for all the help,

Art

5379. MFJ-901B antenna tuner help

I have a total of 5 units of these main frame sweepers
Kruse Systron Donner RF Sweeper Model 5000A. Working Unit. Features include: Adjustable Horizontal Sweep Speed 0.01 to 10 seconds; Horizontal output, Manual Trigger; Adjustable Start, Stop and three Marker Frequencies; Rear Panel connectors for external Sweep, external trigger, external AM modulation, sweep output, blanking output, marker output, 1KHz output; Selectable 115 or 220 VAC input. Designed to work with Model 5xxx RF Oscillator Plug-Ins. $100 each Plus shipping

Kruse Systron Donner RF Oscillator Model 5011. 1 - 2 GHz Working Unit. Features include: RF Attenuator Control; Selectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe $75 plus shipping

Kruse Systron Donner RF Oscillator Model 5014-9. 6 - 8 GHz Working Unit. Features include: RF Attenuator Control; Selectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe. $75 plus shipping

Kruse Systron Donner RF Oscillator Model 5015-2. 7 - 11 GHz Working Unit. Features include: RF Attenuator Control; Selectable Internal or External Leveling; External Leveling Input BNC connector; 1KHz Square Wavewave Modulation On/Off; Retrace On/Off; Type 'N' Connector RF Output. Designed to work with Model 5000A Sweeper Mainframe. $75 plus shipping

Total of 1 each of the plug-ins

Pictures available for all above by e-mail

Source record: 52590

Joel:

I've added a 1.9 kHz and a 350 Hz at 9 MHz.

I find the 1.9 kHz filter to be almost useless. I get much greater benefit from the twin passband tuning.

The 350 Hz filter is very good for CW and RTTY, though I don't do much RTTY anymore. I recommend it over the 500 Hz filter.

For PSK, SSTV, and other sideband modes, the twin PBT is great. I think you don't need anything else.

... Rich

Yep, no PL tone since the radio does not have a PL encoder. I was thinking the cord as well and may end up replacing that. I believe the impedance of the original mic was something around 500 ohms and was a dynamic element. Listening to myself it sounds pretty hot but it is not overdriving it as far as I can tell. The impedance was something I completely forgot about. Besides ripping out the element (I don't have a spare head and don't want to ruin the one I have) is there any way I can change the impedance? Thanks a bunch!

> I guess the hum is not PL tone since it's not there with no mike.

The unregulated output of the Astron is in excess of 20 volts and I certainly would not count on the regulator chips handling that - especially for very long. Even if the regulators can handle 20 volts input, they are generally not heat sinked to disipate that much power. They'll cook in just a few minutes. I found several regulators toasted along with the audio amp IC in the receiver.

In another instance I found the RF amp module on a friends 2M rig fried by the raw output from a Radio Shack power supply that put out 20 volts due to RF getting into the supply.

Source record: 52592

Hi Joel,

I bought a 746 earlier this year... It seems fine to me as-is for SSB and the passband tuning works well. I don't run any digital modes (no computer in the shack--yet), but for CW a filter is mandatory. I got the 500hz in the 455khz position and I'm really happy with it. The only problem is that the twin passband tuning is basically useless without a narrow filter in the 9Mhz position as you're just sliding around the 500hz within the bigger SSB window. I've just ordered a 500hz for the 9Mhz IF and am looking forward to that. The DSP filtering is okay, but I don't think it's any substitute for the real thing here, you need to pull out unwanted signals further back in the chain.

I really like this radio, I think my only disappointment is that I expected more from the IF-DSP. Perhaps I had unrealistic expectations!

That's my .02 anyway!

73s,

Josh / AD6XI

The D-104 usually needs to have the G stand with the internal preamp to work with the low impedance that most transistor rigs have. Just a thought but did you have to go inside the rig and crank up the audio gain for the mic to get this mic to work ?

Source record: 52596
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

As a new SWL, I have a couple observations about different technologies.

As just a general thing, I pretty much use SW for news, nothing fancy.-- BBC, Deutsch Welle, Radio Netherlands, stuff like that. So my requirements are basic and easily met with a bunch of radios. The audio quality though, with some of the old sets is superior, with large speakers and wooden cabinets and such.

Also, the basic tuning differences between analog and digital is crucial --- I like analog tuning; simply that I can tune down into the noise floor and hear weaker stations. That isn't possible with many of the popular modern digital units.

I have a panasonic sw about the size of a pack of cards, clever. I never seemed to use it much at all though, but my boatanchor gets a workout daily. I disagree with the idea that sound quality doesn't matter for short wave listening, with a good radio, fidelity is actually pretty decent.

Anything the same length is going to perform about the same.

But use a Pryme RD-98SMA and its 17" - and you will dramatically
improve 2M and 440 performance. Made from super-thin "piano wire-like"
material, you can actually "fold" the unit into a 6" coil for storage
in a plastic sandwich bag.

And although it's not supposed to work on 220, I am having very good
results using it on my Kenwood TH-F6A, too!

The arguments previous are both all right and all wrong. I'd love to
have an SX28, or an HQ170 / 180, or a Yaesu or Icom, but, IMHO, the best
sounding and best operating radio is the one which:::::
- we are happiest operating ourselves and
- we can afford without bankrupting our families and
- fits our personal application.
When I'm travelling, I take my Grundig YB400 with the windup antenna and
when I'm working in the basement, I use an RCA CR91A with a long wire, in
the garage I have a Howard model 430 with a long wire. All of them give me
pleasure, and I don't really care about someone elses lab measurements. The
radios are paid for and fit the applications I bought them for perfectly.
Just remember - unless it's a competition, it's only personal opinion -
there's no prize!
(just my .02)

Please re-consider using a heavy, telescoping antenna on a HT. The
mass and weight put an awful lot of strain on the HT's connector...

I am having excellent results using a Pryme RD-98SMA on my Kenwood
TH-F6A tri-band HT. Even though it is not supposed to perform well on
220, it sure does!

From: Charles Johnston <ctj92@cableone.net>
Message-ID: <3be434b4@news.bnb-lp.com>
Source record: 52507

Hello Art,
I have had the 811H for over 2 1/2 years with no trouble. Paid $699 new for it at Texas Towers and I believe they are still at that price there. I use mine with a TS450S/AT and use the AT to touch up the match going into the 811H..works FB. One will not see a huge difference between 800W PEP and 1500W PEP. Theoretically about half an S unit. As 'they say' the first 600W makes all the difference.
For some great owner reviews got to www.eham.net and select 'product reviews' and then HF amplifiers. I can tell you the 811H gets great marks from it's owners.
Replacing the 811's with 572's gives added ruggedness and longevity with no increase in power. It is a trade-off since the 572's while lasting longer are quite a bit more costly than the 811's. The 572's would have to last long enough to 'pay for themselves'. My 811H came with Svetlana 811's and they are still working FB. I get 800W as read on a true PEP reading wattmeter (Yaesu YS-60) on 17M and on down with about 60W drive. Going up the band the output starts to taper off . On 10M it is about 650W PEP. The actual spec from Ameritron is 800W PEP on 40M.
Tune-up is easy and there are ballpark settings in the manual to get you going. Once you have tuned up on al the bands print yourself out a tune-up cheat sheet for future use. In my case 10M and 15M settings are so close I can go to either band by just selecting them on the bandswitch knob without needing to touch up the plate or load. Once you get accustomed to tuning up it takes all of 5 seconds..the cheat sheet helps a lot.
Hope some of this has been informative....

I have had Solid State and tube, Heathkit, Hallicrafters etc. I don't see any difference in reception except the solid state has more "bells and whistles". I suppose if anyone has to ask the questions if they had owned both it's a mute point. If you can't tell the difference by ear..does'nt matter..

>> comes with the VX-5R?

> Anything the same length is going to perform about the same.

My Comet SMA-503 is only 8 1/2 " long, an inch or so more than the stock VX5 antenna, yet its performance is noticeably better on both 2M and 440, 440 being substantially more effective. Length is important, but so is an effective match to the HT. Comet seems to do it better than Yaesu.

I'll Second Clint's statement above. A heavy stiff antenna will surely sooner or later cause problems to your SMA jack on the HT. As Clint stated in another post, the RD-98SMA is veeeeery flexible and thin.... ideal for bending and folding rather than removing from the HT every time you want to put the HT in your pocket. (So is my Comet SMA-503 too). BTW, did you know the standard SMA connector is designed for only about 500 mate/disconnect connections?

Fidelity is important to me. I'm very happy with my Drake R8 and a
outboard speaker or the Sony studio monitor headphones I use with it.

>1) I've never owned an amp and am planning on using it with the
>TS-830S and an Icom 746

You will have no problem with either transceiver as a driver. I use
both with my 811H. I highly recommend that you use an intervening
relay between the xcvr and the amp. Replacing the internal xcvr
relays is expensive and difficult compared to an external, intervening
relay (or transistor switch).

>2) Will I see a huge difference between 800 watts PEP and a larger
>amp's output? I don't want to buy the smaller amp if I'll be
>disapointed knowing that larger amp would have made a big difference.

The difference between the 811H and a full limit amp is 3 db, or 1/2
an S-unit on a typical rcvr/xcvr. Your antenna will be much more of a
factor than the 811H output level. I run amps from 500w to 1.5Kw and
seldom do my contacts notice the difference.

>3) I've read that you can replace the 811's with 572B tubes. Do the
>572B's increase the reliability and the power output, or are the just
>a longer-life tube?

The 572B's are more rugged, but the power out will be the same. It is
a factor of the power supply capabilities of the amp. The 572B's are
more expensive, but they are still being manufactured while the 811A's
are not. I suggest you buy some NOS 811H's as reserve stock. Treated
with a little respect, the original 811A's will last many years.

Have fun with the Ameritron 811H......Jim W5JI

Can you help me? I picked up a TE Systems 4412G amplifier at a recent hamfest without a schematic diagram. This is a linear 110 watt brick for 432 Mhz. I can tell someone was inside moving around chip capacitors, and now I need to tame down the amplifier. A schematic would be a big help. Would certainly be willing to help out the sender any way I can.

ACtually there are a number of very good vacuum tube receivers, the
limitations on receivers from the early 1950's onward was atmospheric
noise, not electronics. Tube types that can hold their own agains the
best of the transistor units..
Drake 2 and 4 series, Collins A and S line products , the HQ180 just
to name a few. These receivers tended to have very large dynamic
range, excellent image rejection, a wide range of bandwidths and sharp
skirts.

The reality is most solid state receivers today are modeled after the
Drake 2 series.

These sets do have one other important advantage. They could take a
real beating at the antenna input and damage nothing.

I'd rather have this the other way around: use a solid state autodyne mixer (which needs no filtering) to feed a tube audio amplifier (with very good filtering). Which should be as close as analog technology will ever approach DSP receivers.

You could use a transformer from the element to the rig. "Converting
hi to low Z." Or you could make a small preamp as a buffer and run the
hi Z element into the preamp and then low Z out to the rig. A simple
transformer would be simpler. You would use the little audio type of
transformers. It could be placed in the base of the mike. MK

No , not really. What happens is with the big amps, you don't have to
drive the snot out of them all the time and as such you usually have a
cleaner signal as a result.
>
> 3) I've read that you can replace the 811's with 572B tubes. Do the
> 572B's increase the reliability and the power output, or are the just
> a longer-life tube?

Some say you can do this, but I'm kinda leary. Running 572B's on the
low plate voltage that 811's use is asking for problems. Sometimes
they may work, but sometimes they don't. Another thing about the 811H
amp. They rate it for 800w, but this is driving the snot out of it for
a 4 tube 811a amp. Most conservative makers only run about 600w from 4
811's. IE: Collins 30L-1. I feel getting 800 watts from 4 tubes is
like driving a car floorboarded. You better have good cooling. So if I
were to run an 811H, I would only drive it to about 600w in order to
give good tube life and not stress the parts. I've seen many people
fry 811H's running them to the max. That amp properly run is fine. But
If you want an amp that is MUCH heavier duty and is built to last
awhile, I'd get the AL-80 or whatever variation that runs a single
3-500Z tube. That amp is much better I think, and will do about a KW
out. It's rated at a solid 850W out. You take the plate dissipation of
the 4-811's which is 65watts times 4= 260 watts total dissipation
compared to the single 3-500z's 500 watt plate dissipation and you can
see the AL-80 is twice the amp in tube plate dissipation. It cost a
bit more, but it's way more amp. You'll wear out 811's fairly regular
with hard use. You might run a single 3-500z for 20 years before you
need a tube if you get lucky. My 83 model henry with the dual 3-500z's
is still on it's original tubes and they still do full power.
Actually, if I were to buy a new amp today, it would be solid state.
I'm kind of tired of messing with tubes and all that goes along with

them. IE: I have to have 240 volts to run my henry..The downside to solid state is the big DC supplies you need. The upside is no high voltage, and no tuning and I can easily use it portable/mobile. MK

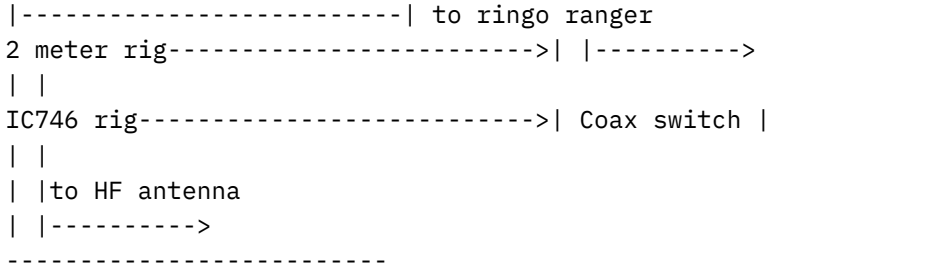
5425. Recommendation on antenna switch

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-04 00:16:41 UTC
From: art burke <pianomanab@starpower.net>
Message-ID: <4q19uto3aafsabtidsu6h2krjvuvem1uj0@4ax.com>
Source record: 52527

OK guys, another question.

I'd like to be able to select between 2 radios and 2 antennas..



I'd like the switcher to isolate the two inputs so that there is no
chance of one radio transmitting to the other.
I'd also want the thing to be able to handle 1.5 kw....
I want it to have low insertion loss from DC to 150 mhz.

What could I look for that would be very reliable (like the six-pack
WX0B stuff)...
It would be nice to have a remote switcher, but I'd much rather have
reliability than conveniece.

Thanks for the help, as always,

Art
KD3EZ

7 months since I left Icom and I don't remember any more but if it is adjustable it will likely be in the set mode. Generally most Icom's detector level is not adjustable. There were a couple of rigs they made where you could adjust the detector level.

Where do you get these numbers, from the Taliban?

For example, the TOW missile has been used by the US Army (and many foreign governments) since 1970. The 100,000th missile was delivered in 1975. Since that time at least another 250,000 have been built. Trust me, they were not totally hand-soldered by master technicians. Tape-on-reel components and auto insertion have been used almost from the beginning. Much of the hand assembly was done by hourly laborers that were in some of the lower labor grades in the factory. (This is not to disparage them, it's just the way it was)

A sample of missiles built 20 years ago and stored in a bunker without any maintenance could be taken out and fired today and still exceed 95% success. Mass produced, solid-state, no skilled technicians tweaking them. Guaranteed.

If you don't think this is possible, you pick a missile, any one you want and you get in the tank and I'll shoot the missile. (I've seen them fired, but never have done one before).

According to your numbers, you have a 94% chance of living. I think you have a 94% chance of dying. Want to take that chance?

I didn't think so.

Audio quality is important to me, too. That's why my "higher-fi" boatanchors get used regularly, while others with roughly equal sensitivity/selectivity gather dust. This has little to do with the original tube-vs-solid-state question, however. If I pipe the output of my Grundig YB400 through a hi-fi amp, the audio is plenty juicy.

5436. Re: MFJ-901B antenna tuner help

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-04 04:50:36 UTC
From: uptown277@qwest.net
Message-ID: <3BE4C91C.4084C222@qwest.net>
Source record: 52538

MFJ manuals aren't available for downloading, but if you call them, they will send you one. They cost about $5.00, though.

Tuning should be the same as my 941. Set the antenna and transmitter knobs to 3.5. Then turn the inductance control around the dial until you get an increase in receiver noise. Use the inductance setting that gives you maximum noise. Then tune the antenna control for further maximun noise. By playing with the antenna (primarily) and the transmitter controls, and ajusting for maximum receiver noise, you'll be close. An SWR meter in line will allow you to see what's going on for best settings.

Hope the helps

Made by Worcester Electronics Laboratory in Frankfort N.Y. serial number
375, model SM-2
This was an excellent BCB DX'ing antenna many years ago. Cosmetic condition
is excellent, it will amplify the frequency you select, but the level of
amplification is down. It will have full output sporadically, I would
assume it is an intermittent connection or something not too complicated.
If you are into BCB dx'ing, this would make a nice nostaglic antenna to
have. I have a Kiwa Loop antenna and have no use for this one. I am open to
offers.
thanks

I have a D model which is not in so good of a condition, and would like to convert the 11 meter section it over for six meter use. I did this years ago with the 29.5 section of Heath SB-101, and unfortunately used the sum rather than the difference in the mixer crystal because I wanted the dial scale to work properly, so even though it did work, the receive sensitivity was terrible and the transmitter only put out a watt or so. I realise that I could just buy a new rig for two or three hundred bucks, but i'm an old-school ham and a glutton for punishment who will probably try it again..

I have a schematic, but no operator or service manual. Would it be possible to get a photocopy of yours? I'd gladly pay for the costs..

> thanks chris ni4l

All the cords are normally rca to rca connectors. The jacks should all be labeled on the backs of the radios to know where goes where, or find a manual. The cable that drake used was like a shielded uncoiled grey mike cable??. It is grey.You can use almost any kind of decent shielded cable. You could even use rg-58 coax and I think it would work fine. Just match the labels printed next to the jacks. IE: rcvr ant goes the the xmtr ant jack nect to the big pl-259. Mute to mute, antivox to antivox , etc. The vfo's cables also are run in this manner. The vfo connection may be inside the case on some of the drakes. I think it is on my old R4. MK

5454. Where to buy mic cord?

[This followup was posted to rec.radio.amateur.equipment and a copy was sent to the cited author.]

Gary,

I went to Circuit City and purchased a power distribution kit, the things the kids use to put those 600+ Watt stereos into their cars. The one I used has very heavy-guage cable, fused, from the battery to the distribution block. The distribution block has two power taps on it; one powers the Icom IC2710H vhf/uhf dual bander and the other powers the Yaesu FT-100D/ATAS-100 system.

I brought the power lead from the battery in through an unused "nipple" (for want of a better term) on the big rubber boot that the wire bundle from the engine compartment comes through. I found several of these on that boot in my '99 Jeep Cherokee. This may not apply to your installation. If you don't want to get a crick in your neck or back from hanging upside-down in the driver's seat to get this stuff in, just go to Circuit City or a sound shop and have them install the power distribution system for you. They're good at that (supposedly).

Hope this helps,

Turner/WA4MQY

From: Don Little <ve6ci@cablerocket.com>
Organization: home user
To: ve6ci@rac.ca

We have for sale a quantity of Motorola GM300 UHF mobiles complete with mobile mounting brackets, mics and wiring harnesses. These are approximately one yr lease returns in almost new condition. The plastic is still on the display on many of them. We guarantee these to be in total working condition and the buyer to be completely satisfied.

The specs are as follows model # M34GMC29C3AA, 16 channel, 16 pin and 25 watts. Split is 438-470 Mhz. We are in Alberta/Canada.

Price is $185.00 plus shipping, shipping may vary as to how the buyer would like them shipped via post or UPS.

Sorry we cannot discount on quantity"

Please email if more info or pictures are requested.

Hello,
Thanks for looking at this I need some help.
I have acquired an Antenna Coupler made by Harris
it is model RF-3281. I have been told that it will tune
1.5 - 32 Mhz but I have no manual, specifications or
circuit details.
If you have any of the above details I would very much like
you to contact me :-
Mailto:G1GYC@QSL.NET

I will pay for any copying and postage.

Or can you tell me :-
1) The operating Voltage of the unit (PSU requirements)
2) The tuning range
3) The minimum wire / whip length that can be used
4) The maximum transmitter power the ATU will handle

Thanks Martin G1GYC

>
>[rest snipped]

Interesting as this topic is, what does this have to do with
tubes versus solid state for SW receivers? A prior poster in
this thread seemed to imply that solid state circuitry was
the reason that so many cruise missiles failed to detonate!
(which is ludicrous, bordering on the bizarre.)

I guess we need to replace all that solid-state circuitry
with vacuum tubes. Maybe our computers will run better if we
replaced the Pentium 4 with the equivalent number of vacuum
tubes? :^)

Tubes have their place, and solid state circuitry has its
place. I wish to know their respective places in high-end
SW receivers, not cruise missiles.

I picked up a box of Ham radio gear at a estate sale (old friend), felt sorry for the widow, you know.

I'm not a Ham but thinking about it some since I was a kid.

Anyway what I got was a AEA CP-1 set up for a Commodore 64 and a Heathkit HD3006 Crossfire Scope.

Now I know technology has advanced and the Commodore has been replaced with PCs..

Do I have anything here worth messing around with if I just want to DX CW and RTTY. I did a Google on the CP-1 and no one has discussed it since 1997. It seems to use it with a PC, I have to do so some wiring tricks with the RS232 cable coming out of the CP-1 and I need some software.

Does anyone have any recommendation on public domain software and the wiring changes for the RS232 cable.

Or should I just salvage the cables and start thinking about Pactor (someday).

Thanks

Steve

Do you have a need for a high-quality SMA-TO-BNC antenna adapter that is custom made to fit and protect your H.T. or scanner radio?

Adapter allows you to:
Quickly change antennas to base,mobile or different style use.
Use the more popular and wider selection available of BNC antennas.
Prevent chassis connector wear or from coming loose due to antenna changes.

Adapter features:
Gold plated contacts with a teflon insulator.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed for moisture and dirt protection.
The base also provides an excellent support for any length of antenna or application.
No need to remove adapter once installed to make a quick and safe antenna change.

Sizes to fit radio models:
Yaesu: VX-5, VX-1, FT-50-R, VX-10, VX-150, VX-110, VXA-100, VXA-120
Icom: IC-T8A, IC-T81A, IC-Q7A, IC-R2
Kenwood: TH-D7, TH-G71, TH-F6A
Alinco: DJ-V5
Standard: C508A, C510A
Radio Shack: HTX-200, HTX-400, HTX-245
Aor: AR-16

Previewed in the May 2000 Issue of CQ Magazine, and the Nov. 2000 Issue of QST Magazine.

$11.95 + $1.50 S+H(One to unlimited)
(Check or money order only in U.S.Funds)
(Specify radio model when ordering)

Thanks, I was thinking that some of the equipment used by people
installing 200 dB stereo systems in their cars would work well.

I'm planning on installing this in my car, Hyundai Excel, my YL's car,
Olds Ciera, a setup attached to a battery pack for portable
operation, and either the battery pack or a power supply brick for the
house. Identical connectors, probably the PowerPole standard. That way
I can easily move the rig around.

Happy trails,
Gary (net.yogi.bear)

Hi,
The SM2 was designed by Joe Worcester in about 1970, and written up for the AMDX hobby clubs. I'm the Reprint Manager for IRCA (International Radio Club of America), and have two reprints covering the SM2 construction as a homebrew project, and an associated article covering the theory of shielded loops. The SM2 used a 12-inch ferrite rod and two bipolar transistors. The input transistor amplified the loop signal; the output transistor used an emitter-follower configuration for a low-impedance output to the AM receiver.
Using the reprints, the antenna should be easily repairable, assuming the ferrite rod is not cracked. I don't think a 12-inch rod is available anywhere, anymore. (Of course, two shorter rods could be epoxied end to end to make a longer rod.)

The metal housing is prone to using your body as an antenna.

I don't have a schematic on the thing handy, but I seem to
recall the mic was ballanced. I replaced a bad element with
crystal wire recorder mic element one time. It seemed to me
that it worked better if I ran twisted pair all the way down the
mic cord and grounded one end at the radio end. The shield
is connected normally to the housing. Also make sure your
ptt lines are seperate all the way back to the radio end.

Otherwise you might try a matching transformer in the base,
then go unbalanced at the output of the transformer.

5480. Audio Mixer Multiple inputs, one output for ham use

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-05 03:43:20 UTC
From: TLNixon@home.com
Message-ID: <3be60a34.137072344@news.moline1.il.home.com>
Source record: 52481

A couple of years ago, I remember seeing a circuit that enabled one to use the audio outputs of 2-3 transcievers and mixed them into one output for a speaker or headphone.

As I recall it involved some LM-324 chips. I cannot find the article, and want to build such a unit for use im my minivan.

Can anyone help??

That is a good point, and also the multiple tuned stages were needed to provide a reasonable degree of image rejection at the higher frequencies for most single-conversion designs.

My favorite power connectors are the anderson connectors. Best in the
west as far as I'm concerned. The handy part is they are ultra rugged
with silver contacts, and all connectors are the same. All will plug
into each other, but you can't go the wrong way. All my rigs have them
as well as all my power cords for DC use from my batteries, and the
power connectors in the cars. So you can hook batteries together or
charge them from the car real easy. I use the grey ones that are rated
50 amps at 600v. "SB-50" They are one piece. These are the smallest
ones they make that are one piece in the "SB" line, but they are still
industrial strength as far as ham use. The bigger ones they make are
overkill for radios unless maybe you want to run a monster solid state
amp amp. Heck, even the dinky 50 amps at 600v version will handle most
amps. :) They also make split apart versions if you want them that
way. They have a website where you can check them out. I've been using
these for over ten years and wouldn't use anything else. They are that
good. They aren't exactly cheap, but it's worth it. I think the last
batch I bought they were 4-5 bucks a piece. I'd have to check. They
last for years. You might be able to find these online somewhere. I
think anderson only sells in bulk. I've seen some graingers stores
thats sell them. Oh yea...online electronics in CA. sells them or did.
(714)847-5111
Thats where I got my last batch of them. "SB-50a" MK

Not a bad idea. Also I remembered on the drakes. The lines for the VFO
are called "INJ" on the drakes. So those need to match for both VFO's
to work.
Thats the one that is on the back of the xmtr, but inside the
receiver. "You have to take the cover off unless you can squeeze your
fingers in there" Or at least it is on mine. Later versions might have
put it on the back of the rcvr. Just make sure the "INJ"'s match up
wherever they are. Same for all the others. MK

I have no idea really, but if it's made to match the Harris amps that they made for commercial/marine use etc, it will probably handle quite a bit. At least 500 watts anyway, maybe more. Does it look big and hefty? Like it came off a ship? They made some pretty good stuff. I know many people that have run the harris amps that they got surplus or whatever. Built like battleships by what I hear although I've never messed with them. If its ex-marine, guesswork about likely ship antennas might give you an idea on what it would do. :/ MK

I, too, am not familiar with that model number although I have used Harris gear on many merchant ships
I've served aboard. Those were the RF601A coupler and it's control unit RF601A/C. The control unit
ran from 120 VAC and included a p/s of 24-32 VDC which supplied the coupler via a multiconductor cable.
They would tune 2-30 Mc and handled a kilowatt. The control unit was rack mounted with the transmitter.
We used them with large 26 foot fiberglass whips (8 inches at the base, tapering to 2 inches at the tip).
They would probably tune a wet string. The coupler itself was approx. 30 x 18 x 8 inches and weighed about 80 lbs or so.
It was basically a rectangular box with a domed cover. The cover attached with a heavy neoprene gasket
between it and the box and the whole thing was charged with nitrogen to keep it dry.
The "guts" included a large roller inductor and a vacuum cap rated about 7 or 8 KV, both motorized.
It would tune that whip to any freq. in about 2 or 3 seconds. This may not have answered your
question given the difference in model numbers, but hopefully tells you something about what their gear is capable of.
Toronto Surplus sells these units used for 700 to 1000 dollars. Or check with Harris themselves...

From: art burke <pianomanab@starpower.net>
Message-ID: <5cvcut4e443qrh4m12arpkvmh02emp8lkj@4ax.com>
Source record: 52398

This may be a dumb question, but can the 811H do AM? The ALL-80B has it listed in the manual I downloaded off Ameritron's website, but no mention of the 811H doing AM.
Since the IC746 does AM, I'd like to be able to have the AMP that will work in that mode also.

Thanks,

Art

Thanks Ralph, I have the manual and the schematic for the CP-1 and you are correct about the optional RS-232 port on the CP-1. The it takes a couple common chips and the connector to bring the unit up to RS-232 capability. I could easily do that upgrade if I find this old unit worth while at all.

I guess I'm an "ole sucker" for obsolete technology. I hate to throw it away. I'm almost tempted to dig up an old Commadore 64 just so I can play with it. At least I have the software cartriges for that computer. (Just kidding.)

If anyone knows of a DOS or Windows shareware (freeware) that is still available for this equipment I would appreciate it.

Thanks

Steve

5499. Rx Audio Mixer Multiple Inputs-one speaker... need schematic

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-05 13:08:14 UTC

I am interested in a schematic for one of these mixers. I think I saw it one time a few years ago in QST, but I cannot find it now.

I am interested in building one for use in my van to mix the audio from my HF and VHF rig into one speaker, or one headset.

As I recall, it used some LM-324 Chips.

Terry-WB0VQP

5500. Re: AEA CP-1

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-05 13:12:40 UTC

Source record: 52400
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

The cp-1 was just a demodulator unit. The output was just a simple
conversion of the audio tones to whatever the Commodore used or some
versions had a rs-232 connector that could be plugged into a computer
serial port and would put out a + and - voltage as the tones changed
from mark to space. If you have the serial port installed in the cp-1
then you may be in good shape. All you need to do is find some old
softwear to use it. It may take a long time to find any as most of it
was written for old DOS computers. If the cp-1 does not have the serial
interface for the IBM/MSDOS type computers it may be some problem to
make it work unless you can find a schematic of the cp-1 and install the
parts .

YOu may be beter off going here:

http://www.muenster.de/%7Ewelp/sb.htm

and looking at some of the sound card programs. The one called
something like mmtty is very good for rtty.

FOR SALE

Pair of brand new in boxes Telefunken VF-14 tubes
These are used in the famous Neumann U47 microphone.
Sold elsewhere for $1000.00 to $1750.00 each
See:
http://www.bavodekker.com/vf14.html
http://www.soniccircus.com/accessories.html
http://www.classicelectronics.com/Mics.html

Will sell for $750.00 each plus shipping.

5502. Re: 811H-Followup, can it do AM?

Any amp that can do ssb can also do am. YOu will have to derate it by a whole lot. The maximum would be around 1/4 the carrier level as the ssb level. It may be a lot less depending on the tubes and power supply in the amp.

Nothing at all (Why do you think it did?). I was merely pointing out that, while merely owning an amplifier is not illegal, one needn't do anything illegal to be attacked by our government; a warning to unlicensed folks considering buying one.

I'd welcome suggestions on a small 2m HT for my wife, who is not really interested in ham radio, but who is taking the Tech test this Sunday (consistently scoring 100% on the practice tests!). We've been using some very tiny FRS units, about the size of pagers, with antennas about 3 inches long. We want her to have something that will reliably hit area repeaters and be useful in simplex over a longer distance than our FRS units, but that will still be convenient to carry in her purse. She's seen my IC-2SRA and passed judgment on anything like that ("No way!"), so I need help finding something smaller, yet not powerless. I like the little Yaesu radios, but they (and others with small housings) always seem to come with these long, inconvenient antennas. The stock antenna on the Kenwood TH-22A looks more reasonable, and the radio will produce 5W without a battery the size of a pay phone, but I'd be pleased to know what more experienced folks can suggest. Within broad reason (up to $300, say), price is not the issue. Mostly, what I'm looking for is the smallest unit, antenna included, that will give her a few miles of reliable simplex. Ease of operation and DTMF paging would be nice features, too.

Last time I looked into the question, the 2SRA was a new radio, so you can see I'm a little out of date. I've looked at the online sites and developed some idea of her options, but I'd be grateful for advice from those of you who are more in the know than I am.

Thanks,
Crusty

I see no one has responded to you yet.

Don't know any web sites for this, but what I would do is wind a quadrafillar toroid coil. That is, take 4 wires twisted together and wind the bunch(all together) on a toroid core. Pick one of the individual wires as the '1' part, and connect the other three in series for the '9' part. (The ratio 9:1 is the square of the number of turns on each side of the transformer.) Make sure you connect them start-finish-start-finish-start-finish or you will have a short circuited transformer!

You will have to use the proper type of toroid. And a big one to handle the transmit power. I would also consider stacking two toroid cores together to get even more power handling.

Good morning, Crusty.

I have a Kenwood TH-F6A that I like, though it may have more features
than your wife will ever use, and at $389 street price, it's also a
bit over your $300 budgetary limit.

The stock antenna isn't too bad size-wise, and in any case you can buy
a shorter one from Ham Radio Outlet or other stores like that.

Your wife may enjoy being able to listen to AM or FM broadcast, the
sound track from TV channels, or maybe aviation and public service
frequencies, all of which (and much more) are included in the TH-F6A.

It also listens to AM, SSB, and CW on the shortwave bands, though you
may as well forget about that without an external antenna.

Hope this helps...

I have received my shipful (actually a few truckloads) of 7 Amp-Hour POWER STATION gel cell batteries with wall charger and car charger as described at http://www.hamcontact.com/products.html . These are the units that I have been advertising in QST, CQ, etc., for years and are excellent for powering the new Yaesu FT-817, Icom IC706, etc. I am offering them at $39.95 plus shipping. This is $20 below the price that the major ham radio stores offer. You'd be paying 50% more if you bought from them. This is a once in a long while offer, and will be valid only until the end of this month (Makes a great Christmas present).

If interested either call 800-933-4264 or order via our secure website at www.HamContact.com

YOU MUST MENTION THAT YOU SAW THE REC.RADIO.SWAP LISTING TO GET THIS SPECIAL PRICING.

Thank you and please pass this message to a friend who might be interested,

Joe N6YYO
THE HAM CONTACT.

p.s. We also have larger 17 Amp-Hr gel cell "Jump Start" systems, Solar Panels and DC to AC inverters from 140 to 3000 Watts in addition to our radio amateur gear (no radios).

For me I went with the Vertex VX-150. It's a lot of 2 meter radio for
the price ($159 at AES, HRO, R&L, and others) and it's small enough
to carry without feeling like you have a brick in your pocket. Has a very
good sound on receive (for a HT) and I have a friend that swears it
sounds like my base (Kenwood TM-G707a) over the repeater. All in
all I would buy another one in a heart beat!!!

> i'll bet none of the ham dx or ontest winners use a tube rx..

I'm afraid you'd be wrong about that - while there are still a few contesters using tube receivers (almost all the Drake R4C which is indeed an excellent receiver) most are using solid-state gear.

In large part this is due to the convenience factor. There are no tube receivers available which will automatically control the frequency of a solid-state transmitter. Keeping the number of controls necessary to change frequency to a minimum is critical in a contest station. Having separate frequency-control knobs for receiver and transmitter is not acceptable. Nor is having to re-resonate the tank circuits when changing bands - something that's required with tube transmitters. Also, computer control of frequency is quite important, a feature not available in tube sets.

There is no good reason someone couldn't *build* a solid-state transmitter which could be controlled by a tube receiver, or add a frequency counter with RS-232 interface to a tube receiver. Except that with the high cost of small lots of parts, it's way too expensive. Even if one did have the time and tools to do it.

Modern solid-state receivers do have very good performance, IMHO nearly as good as the best tube sets. Factor in the operating advantages and the tubes really don't have much of a chance.

Typical amplifiers sold in the 1960's and 1970's really for the CB market, but
marketed "under the disguise" that it is for amateur radio (10 meter band).
Be advised that these are not amateur type accepted amplifiers.

The dead give-away is the 5 watt input. Many early versions used old TV
"sweep tubes" for the finals and were of questionably spectral purity. They did not call
these TVI or RFI monsters for nothing. Be especially cautious of any units that have
been tampered with the "urban legend" to remove the band filtering for more power.
More power everywhere, except where you want to be transmitting.
A 5-element Chebyshev filter (1996 ARRL Handbook, p. 16.9) is always a good idea.

Give the wide spread availability of the solid state versions (Palomar and other clones)
why go tubes for regular operations.

Now if you want a collectable item for "the era", cosmetically it looks to be in good shape.

5517. Help! Cherokee AH-50 sound problem

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-05 19:28:12 UTC
From: kathygranek80@ivillage.com
Message-ID: <3b4a3cb1.0111051128.9dfa2e3@posting.google.com>
Source record: 52419

This radio was given to me by a friend who is not longer active in ham radio. I can set the unit to key up repeaters in my area, but although I can *see* the bounceback on the LCD display, no audible sound comes in. I set the correct PL according to what the repeater guide advised, but still no sound. When I turn the TONE key off, sound comes back in, but it's only the sound of squelch. I have yet to hear a single conversation on this rig. I am pretty sure the signal hits the repeaters since, as I said, I can see the visual when TONE is engaged, but there's no sound otherwise.

Any ideas as to what's wrong?
Thanks, Kathy.

Paranoid BS. The chances of getting unjustly "attacked by our
government" are approximately the same as getting hit by lightning.

> a warning to
> unlicensed folks considering buying one.

Yeah.... "Awake, Ye Unlicensed amp buyers! Arm yourselves! Resist the
onslaight of the fascist oppressors!"

Heh heh heh, sorry.

I think that your first problem is that you need to get an amateur radio
license before you hook the thing up to a radio.

hello everyone,

Jon's question appears to be whether there is a sensitivity/selectivity/audio (as a package) advantage of tubes or transistor in shortwave receiver design. since he is not talking about memories, digital tuners (etc.), i would be inclined to say they were INHERENTLY very similar. An EE could design similar units looking at the basic receiver sections (rf amp, mixer (rf oscillator), if amp, detector, and audio amp). now if we go on to talk about signal amplification via tubes versus op amps (operational amplifier IC's) that is another story.

Jon also asked which was better in the REAL-WORLD: there i would have to say solid-state because of SIZE. small size means more amplification units: for example you would need over a dozen for even simple AGC designs... not to mention hundreds of thousands of switching transistors for digital memories etc.

Jon went on to ask which models were representative of these 'best' units... a good start may be to look at the best Drake tube units of yester-year and compare them to the best Drake solid-state units of today. here is a link for the Drake museum:
http://www.dproducts.be/drake_museum/

Jon also wanted to know about current radios which have a good cost relative to their performance, for this i provide this link:
http://www.rnw.nl/realradio/rx_current.html

my 5 cents (inflation),
phil :)

Hi Greg (and Steve),

Your a little off track Greg, but I'll try to add in some corrections
where possible.

: In rec.radio.cb G. Beat <gregory.beat@home.com> wrote:
: Typical amplifiers sold in the 1960's and 1970's really for the CB market,
: but marketed "under the disguise" that it is for amateur radio (10
: meter band).
: Be advised that these are not amateur type accepted amplifiers.

More accurate to say the amplifier is of a style sold in the 70's, often
made for the 25 to 54Mhz band which includes the CB Radio Service. The
unit shown is a current production unit... made in Italy if my sources are
right. More and more, they are starting to pop up on Ebay and the news
groups. This one is not a vintage item...
-
Nope, they are not type accepted, nor were most of the legal amplifiers
sold back before the ban. They just had to make a legal spec for the most
part. Operation of the mentioned in the US Class D CB Band is not legal.
-
Operation in other adjacent services is/was possible.
-
: The dead give-away is the 5 watt input. Many early versions used old TV
: "sweep tubes" for the finals and were of questionably spectral purity.
-
While not orignally designed for RF amplifier service, the common sweep
power tubes can be used in an amplifier and with proper design care can be
quite clean in a linear application. It's all about doing the
proper design homework...
-
: They did not call these TVI or RFI monsters for nothing.

who is "they"..? Most people don't do the ground work to build a proper
sweep tube amplifier. Like any and all poor built/operated circuits...
the parts can get a bad rap.

Sweep tube amplifiers can be made quite practical. Many of the various
companies have put out various models through the years. Swan, Yaesu,
Dentron, Amp Supply, SBE ... the list goes on. Some were not so hot...
some were pretty nice.

: Be especially cautious of any units that have
: been tampered with the "urban legend" to remove the band filtering for more
: power.

Any tampering period... how come we haven't seen this "urban legend"
label before..? Wait a minute.... I've seen some pretty dumb posts about
removing the modulation internal limiter of a radio, made by Bill ...
that's an urban legend that's a lot of crap. So we actually do have a
current example.
-
: More power everywhere, except where you want to be transmitting.
: A 5-element Chebyshev filter (1996 ARRL Handbook, p. 16.9) is always a good
: idea.
-
You can actually do ok with just the pi output if your practical. But the
additional filter is a welcome addition.
-
: Give the wide spread availability of the solid state versions (Palomar and
: other clones) why go tubes for regular operations.
: Now if you want a collectable item for "the era", cosmetically it looks to
: be in good shape.
: Greg
: w9gb
-
Because it's a current production unit... Sweep tube amplifiers can be
heaven or hell. Your results will probably be different.

cheers
skipp

An EE could design an autodyne mixer w/no filtering, directly producing
audio by using solid state, such as a PLL tuned to the carrier frequency,
that would not drift. It would be like exalted carrier SSB. Or are you
going to say that this could also be practical with tubes? Were there any
tube receivers with decent AFC?

> and audio amp). now if we go on to talk about signal amplification via tubes
> versus op amps (operational amplifier IC's) that is another story.

While solid state allows for inherently dissimilar alternative designs
not realistic for tubes, I'd rather not use solid state for amplification.

When an overcurrent condition is present the voltage will indeed foldback to a safe current level. You can short circuit the output and the voltage will foldback to nearly nothing and no damage will be done. That is a function of the LM723 regulator. The supply does have an SCR crowbar for overvoltage protection.

It would not be my first choice for running a 100 watt rig , however.

Too sweeping a statement. Certainly a tube receiver is not about to
control a modern synthesized rig. But what about older geat where a
common VFO frequency of 5-5.5MC was used?
Keeping the number of controls necessary to change
> frequency to a minimum is critical in a contest station. Having separate

The above is again over generalized. For example, the CE200V was a
tube set that required no tuning.

The only tube in any of my gear is the CRT for the PC monitor.

Maximo:

i was saying that amplification could be done with tubes or transistors with basic designs; however, like you say its a matter of being practical because of the size, power, etc. requirements.

you stated you would rather use tubes for amplification... a hybrid unit? it appears the problem with some DSP units is that they rely too much on the DSP as a fix for a poor front end or the DSP does not have good enough resolution (bits).

phil :)

> overvoltage protection.
>
If the pass transistor shorts then you get maximum output voltage regardless of what the LM723 does. With an RM20 the thing doesn't fold back until 20 amps because that's the maximum *intermittent* rating. The pass transistors will overheat if you draw a continuous 20 amps as in RTTY however. That usually results in a shorted pass transistor.

All power supplies should have a fuse in the (+) line between the capacitors and the SCR crowbar so that the SCR doesn't have to discharge the capacitors in order to disable the output.

5543. Portable Handcranked Shortware Radio

Hello,

My girlfriend is headed off to remote parts of Bolivia w/ the Peace Corp and is interested in purchasing a portable shortwave/worldband radio. Since electricity will not be an option she needs a solar powered/ hand cranked type of unit.

I've looked at the Freeplay FPR2 and the KA007 Solar Dynamo because she can only take a total of 80 pounds of gear.

Given your experience, what unit mentioned or unmentioned would you recommend.

Thank You,

Dan

5544. IC 746 tuner problems

5547. Re: switching power supply with lowest EMI/RFI in ham bands

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-06 04:33:24 UTC
From: Mike N5MJ <n5mj@TRASHhotmail.com>
Message-ID: <9s7p68$8vc$1@slb1.atl.mindspring.net>
Source record: 52349

I'd have to agree with Jeff. I stopped in Radio Depot in Seattle one day and tested three switching supplies for RFI - which the nice folks there were nice enough to oblige with an HF rig and a wire antenna inside the store. I powered the HF rig from each of the supplies while listening for RFI through the range of each HF band - particularly on 75 and 40.

Results: The MFJ emitted little or no RFI. The Alinco switcher (with it's variable VFO QRM generator) was absolutely the worst. S9 QRM every 15 KHz on 75 and 40. The Astron switcher had somewhat less QRM, but still excessive by my standards.

By far the MFJ was the best. Side bennie- it was the cheapest, and lightest, and fit in my carry-on. I bought the supply in Seattle and took it with me on my flight to Texas! Never even knew it was in there.

I have a analyzer 3 for sale in almost mint condition. comes twith a extra 4th station and the following cups for charging,

GE/Ericson
Motorala Flip
nokia/AT&T
Star Tac.

Asome charger and you can order any cups from W/W for about 29 bucks from ham HTs to cam corders to commercial hts. You name it they got it. Hers is the web site too.

www.wwassociates.com

Asking $500.00 shipped. Charger with acc would cost way over 600.00

Possible trade for HF rig.

I've a J.W. Miller AT2500 Auto-Trak Tuner that is misbehaving.

Though the forward and reverse power indicated on the meter is correct, the SWR meter is dysfunctional. As the auto-tune function is also out to lunch, I assume the problem is likely in the section that determines SWR. Unfortunately, I cannot find my manual or schematic.

Does anyone out there still have a manual and/or schematic for this product?

I prefer to purchase the manual but would be willing to pay reasonable copying costs if you don't want to part with the manual.

Thanks
--Rick AH7H

Geez Skipp, do you make this stuff up as you go along? Sweep tubes
were built for TVs, not radio amps: They work great in the kHz range,
but are terribly non-linear at 27MHz. The result is splatter all over
the band, regardless of how many filters you pile on top. The only
way they worked (with any kind of usefulness) was with heavy negative
feedback, and the tubes burned up very quickly. At the time when
sweep tubes were cheap it was a poor-man's alternative -- definately
not true today.

For UK based readers ,Brand New ,make Kiel - Germany (nearing end of shelve life) 12V ,18Ah gel type batteries are available from Mainline Surplus - Leicester for GBP 12.50 each (incl VAT) equiv US$ 18.25
I bought quite a few and am very satisfied with their performance .
I use them in the shack (charged by a wind generator + home brew charge controller limiting voltage to 13.8 V).
To keep the batteries healthy I discharge them every 3-4 months to 11.5 V otherwise they become 'lazy'.

My wife uses one with her electric golf trolley as a direct replacement for the original Yuasa battery which lasted 4 years .

Just for info

Source record: 52359

If the actual SWR of the antenna you are trying to tune is over 3:1
then it is normal action for the 746 tuner to hunt. It may tune some
antennas with that high of mismatch but 3:1 is the upper range of the
tuner specification. It also may hunt when looking into a purely
resistive load.

If the antenna is below 3:1 you might have a relay that has been
damaged. Damage usually occurs from attempting to tune too high of a
mis match. Sometimes the damaged relay is easy to spot as the case of
the relay will be puffed out where a undamaged relay is not puffed.

I'd prefer to have separate components, as much as possible, say:

1. computer for database & control
2. solid state autodyne mixer for direct conversion from ECssb to AF
3. tube amplifier w/ good filtering

> appears the problem with some DSP units is that they rely too much on the
> DSP as a fix for a poor front end or the DSP does not have good enough
> resolution (bits).

As for DSP units that simulate autodyne product detection and so are
either not doing a good enough job or wasting silicon, when the job could
be done better or simpler by a PLL providing the exalted carrier.

The Freeplay unit is the heaviest one. There are other much smaller ones such as the Info-Mate from topixgallery.com for $60 and the Luke from universal-radio.com for $40.

The small ones should do a just as well when using an earphone; it's only their small speakers that are their major drawback. They might not be as sensitive, but that can be made up for w/an external antenna clipped onto the telescopic.

I'd recommend buying the Luke and a $9 wind-up antenna from Radio Shack, and then leave them behind in Bolivia.

Hi Gang,

I have an Advanced Receiver Research 432 pre amp for sale. This is the one
that will handle 25 watts through. Excellent condition. Not using it. $60 .
If you have any questions please let me know.

n0kq@arrl.net

If low total-weight and size is a primary objective,
for travel consider Sangean ATS606 also sold
as Radio Shack DX-399. This will run for about
30 hours on 3 AA batteries, so she would need
to take a bunch of those. Depending on how long
she's there and how much she listens, that still
may weigh less and take less space than one of
those wind-up radios? I'm pretty sure it would
perform better for SWL, which must be of some
importance.

>who are more in the know than I am.

Your 2sra isn't listed in any of my catalogs -- I guess it was built years ago.
I have a little Icom ic-t2h for two meters, and it's only about 4 or 5 inches
high, and the antenna is maybe another 6 inches. But the antenna has a bnc base,
and twists off in only a second, so the rig would fit most any purse. Keep in
mind, no 5 or 6 watt ht is going to be as small as a 1/2 watt cell phone or
pager, just because the battery has to be bigger for the ht's extra power. But
most of the modern-day wonders will fit into your wife's purse, if you detach
the antenna. I like my Icom; I've also read good things about the Yaesu vx-150.

Good luck...

: In rec.radio.cb Sparky <fgillil@tincan.org> wrote:

You are quite the bafoon Sparky... your follow up posts read just like the "grouchy ham hit the road types" mentioned on the last page of the http://sonic.ucdavis.edu/siltronix web page.

: Geez Skipp, do you make this stuff up as you go along? Sweep tubes
: were built for TVs, not radio amps: They work great in the kHz range,
: but are terribly non-linear at 27MHz.

Just because a device was designed for one application, doesn't mean it won't work well for other circuits. Sweep tubes can and do preform into the lower VHF spectrum.
Your terribly non linear statement is crap... They can and have been used in linear rf amplifiers that exceed past and current fcc spectral requirements, thus some could receive type acceptance numbers on the chassis (pre fcc 10 meter ban era).
Companies like Swan, SBE, Yaesu, Dentron, Amp Supply and others did a fine job making low cost linear rf sweep tube amplifiers. But of course, you know everything...

: The result is splatter all over
: the band, regardless of how many filters you pile on top. The only
: way they worked (with any kind of usefulness) was with heavy negative
: feedback, and the tubes burned up very quickly. At the time when
: sweep tubes were cheap it was a poor-man's alternative -- definately
: not true today.

I guess all the amplifiers I have working (on 10 meters) with their original sweep tubes need changing and an extra filter or two on board? Your lack of actual experience using sweep tubes in rf service is quite evident.
Something will have to be done... my restored sweep tube amplifiers are actually cleaner than my non modified type accepted Amateur Radio. I guess my spectral display tests are off the mark again... darn Agilent and original HP gear didn't hold up when I spilled coffee in the front panel...

I hate to rain on your faulty technical parade, but few if any of the above mentioned Amateur Radio - Company made rf amplifiers have negative feedback. You blow a lot of smoke there buck'o...

I do suggest most sweep tube amplifiers have a bit of degeneration installed as described in the Dentron Article above. But you can take your negative feed back back to your first year electronics class and

learn the difference between it and degeneration.

You might want to jump in with the neutralization crowd in your next post for a different angle. Darn sweep tubes in amplifier service seem to be working much better than you say they should.

Life goes on...

I've got a Freeplay S360, and it seems to have quite a bit of hum on AM when it's unwinding. I'd think, if you can find one, a solar charger for AAs, two sets of NiMH batteries, and a DX-398 wouldn't weigh much more than the SW Freeplay.

Check specialized battery stores for the charger. Most of them have something along those lines, or at least all the parts you'd need to make it.

Don't forget to send along a spool of light-guage wire for an antenna, as well.

Steve,

First, you do not need an amateur radio license to hook anything up to a radio, but you need one to transmit. Go ahead an listen all you want. Second, if you are talking about software to run an old TU, you should think twice about whether you simply want to see the old box run, or whether you want to copy RTTY and/or PSK31, and/or other modes. For the first two, if you have a PC with a sound card, free software is all you need.

Try here for Zakanaka (PSK and RTTY, using the MMTTY engine) and also Logger:

http://www.qsl.net/kc4elo/main.htm

Or here for MMTTY (RTTY) and also MMSSTV:

http://www.qsl.net/mmhamsoft/

Everything you find at these web sites (Logger included) is free, meaning you CANNOT pay any money. Once you have the PC, and tones coming out of a radio speaker, your cost to listen is the cost of a pair of wires from the audio output of your radio to the mic or line input of the sound card.

It seems to me that if you want to use the CP-1 for the sake of nostalgia, you should leave it unmodified and find a Commodore into which to plug it.

Your next step should be to drop by Radio Shack and pick up a copy of "Now You're Talking," and we'll see you on the air soon.

FOR SALE:

AKAI model M8 REEL-TO-REEL, Stereo tape deck in excellent condition.

This is a classic commercial quality unit with seperate
left and right amplifiers, metering and electronics.

The case, including the cover, is in great shape as are the
mechanical and electronics. The gray tolex/vinyl covering is in
beautiful condition and the deck works fine, other than the rewind
does not run.

Pictures available on request.

Will sell for $75.00 plus shipping

Quite right. It was all the rage in 1991, because the cellphone craze was
just getting started and the restrictions on cellular scanning had not yet
arisen. Digital cellphones hadn't taken over yet, either, so one could
listen to lots of analog traffic, if one wanted to. The 2SRA has a tidy 2m
xcvr, but a wholly independent wideband rcvr (25 Mhz to 950 MHz). But, it
has tiny little buttons and a complex user interface, as well as being too
damned big for what it does. Lots of reviewers criticized the rcvr antenna,
as well (it's a funky thing with an audio connector instead of a BNC).

> Good luck...

Thanks. Responses here have been very helpful, and I think we can make a
good choice.

Source record: 52385

It will foldback with a dead short, and not deliver 20 amps in that condition! I've had 50 amp Astrons "false" (SCRs fire on a noise transient), and stay in a shorted condition for days before the site could be visited and the supplies reset. The supplies are ice cold--they don't sit there delivering full current into a dead short--and that is what I wrote. If the pass transistors short, the SCR will fire and hopefully protect the rig.

I agree with the fuse observation between the crowbar and filter cap, however, and that is something anyone with a ham license should be capable of doing on their own. Not running a 100 rig on RTTY keydown on a 15 amp rated supply is another. If people abuse and under-rate power supplies, they get what the pay for. Astrons are solid products for the money. They did make a small 7 amp linear supply that was very prone to abuse and failure by FM operators, IIRC; we got a lot back for repair at Norbill Electronics when they were in business.

Thank you all for your suggestions.

For SSB, I will probably plan on a 9 MHz IF, 1.9 KHz filter. That sounds like it should work well with the DSP.

For CW and digital, its still a question of the 350 or 500 Hz filters. From Rich G.'s comments, it seems like the 350 works on digital as well as CW, so I am leaning that way.

Don't know if the extra cost for a 455 KHz filter would be any advantage? So, will stick with 9 MHz.

Also noticed the posting of "FAQ: Icom IC-746 Transceiver", to this group. It is pretty long, so haven't read through it yet.

Thanks again.

> It will foldback with a dead short, and not deliver 20 amps in that
> condition!

That's true but the voltage is controlled by the pass transistor. If the pass transistor is shorted then the supply output voltage will rise to maximum because the regulator IC is no longer able to control the voltage. The SCR will fire to protect the rig but if it is tied directly across the capacitors as it was with my Astron, it may not be able to handle the very large current developed in attempting to discharge the big capacitors. In my case, the SCR opened, permitting the full output voltage (in excess of 20 volts) to be applied to the rig.

I agree that anyone should be able to add the fuse but a properly designed power supply should have it included by the mfg. Most people will assume that a supply they have purchased is properly designed and will not check it until after they have had a failure. I'm only passing along my experience because it might help someone else to save their rig. r prover-voltage crowbar protection may not work as planned.

5587. Yaesu FT-890AT runs hot!

Source record: 52389

HI folks, I have a Yaesu FT-890AT and it seems to me that it runs awfully hot while just in receive mode. Everything works just fine ... but it feels very warm, almost uncomfortable to touch on both the top and bottom. The specs say it only draws 1.5amps @ 12VDC in receive so how can it be getting so hot? Is this normal for the 890?

I have a FT-757GX, which of course is a similar older radio, it's specs say it draws 2 amps in receive mode ... it doesn't get hot at all ...

Heathkit Oscilloscope Probes, Two excellent items on Ebay

Heathkit Universal Oscilloscope Probe, PK-1

This universal scope probe is in excellent condition. Included are the original box, instruction brochure, and warranty card. I've never actually used the probe, so I'm not certifying its functionality (but there is not much to go wrong).

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1660000805

Demodulator Probe for Oscilloscope - 337-C

This demodulator probe is in excellent condition, except for a minor melt mark on the front plastic housing (see picture). Included are the original box, instruction brochure, and warranty card. I've never actually used the probe, so I'm not certifying its functionality (but there is not much to go wrong).

For auction on Ebay, click on:

Palomar Preamp P310, Ebay

Covers 160 through 6 meters. I bought this at a hamfest a few years ago for $50 from a nice fellow who said that it worked perfectly. I haven't used it, so I decided to sell it. Just to make sure it worked, I plugged it in and nothing happened (rats). I opened the cabinet, and found no visible evidence of damage. (Even the fine wires to the toroids are intact, so I suspect a transistor or possibly a bad solder joint.) I don't have time to work on it. The cabinet is in excellent condition. I'm selling it strictly "as is".

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

Pay by money order or PayPal. UPS shipping charges will be estimated based on the weight of the packaged item and your shipping address. I will send you the UPS tracking number, which you can track via the Internet. The item will be shipped immediately upon receipt of funds, and will be packed properly, to help assure safe delivery.

For auction on Ebay, click on:

Another reason to buy a T2 - the price has dropped to $99.95 (street price) for the version that does not include the batteries or charger. It's called the T2 "Sport". It performs well although it doesn't have a plethora of features.

Ummm, I think what he's saying is that he is selling the 'Power Station' product at reduced price; not just the battery and chargers. On the web page the 'Power Station' goes for $49.95 + about $11 shipping. So the price is down $10 which about pays for your shipping.

At least, that's how I read what he says below.... 8=)

And you use toilet paper in your typewriter, too, huh? I never said
no amps were made for sweep tubes, I said they are non-linear when
used as an RF amp. And they are. I also said they can be made to
work with a reasonable amount of linearity, but not very efficiently.
AND I also said that if they are not linear, no filter will make
them linear. Why do you insist on putting words in my mouth?

> working much better than you say they should.

I would like to see your data, because I haven't seen a sweep tube amp that didn't have spikes up the spectrum or noise sidebands less than 200kHz wide.

Now where did I say that degeneration = neutralization = negative feedback? I didn't. But it's obvious that you don't know what the terms mean. 'Neutralization' is degeneration included so to prevent oscillation. 'Degeneration' is any type of method used to limit the open-loop gain of an amplifier, and includes 'negative feedback'. And if you take a real good look you will see that the 'neutralization' added to an RF amp is usually in the form of 'negative feedback'. Degeneration is used to reduce distortion, and is usually done with either a cathode resistor or negative feedback. If distortion is heavy, as in the case of sweep tubes, both should be used.

Also, you seem to be under the mistaken impression that just because an amp was mass produced by a well-known company that it necessarily -must- be a good design. Corporate America has provided many examples proving that to be false. But I'll tell ya what, Skipp: You provide just -one- example of a commercial radio that uses a sweep tube for the RF final and I'll eat my words. I'm not talking about junk made for some impoverished amateurs, but radio equipment meant to be used in a commercial radio service. Just one. How about it?

5594. HF Mobile Amps??

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-07 02:01:36 UTC

My 13 year old son got his Technician ticket and got me hooked. He and I are testing for our General tickets and I've been researching what would be a good "all round" radio. My studies took me across the Yaesu FT100D since it would allow us to work CW and vox over the the 70cm to 160M bands, at least allowing us to talk while we try to build our own homebrew boxes (what a great father-son project!)

The specs look good, and the sales brochures look great - but I'd love to hear about any "real world" experiences before I drop several hundred American Dollars on a new one.

Any thoughts? Your opinions on good "starter radios" are appreciated.

Where can I obtain a block diagram of the Kenwood TS-530S? Or a manual with schematics? I don't know much about it, is it all solid state or are there tubes in the final? If so, has anyone converted it to SS? Please cc replies to: aa1ll@qsl.net , thanks.

Dave:

I went through the same thing when I was looking for my first rig.. I was looking at the FT-100D and the ICOM IC-706MkIIG. Here's what I found out.

I talked to at least 10 people who had each rig.

Of the 10 that had FT-100D's, 9 said they'd had to send them back for repair within the first 6 months. The 10th was lying. (I got that tidbit from someone who knew the guy who lied, and knew he'd sent it in for repair)

Of the 10 that had IC-706's, NONE of them had sent them in for repair.

I've had my 706 now for 4 months, and I'm thrilled with the rig. It does CW and VOX, just as the FT-100D does. In fact, the only real difference that I can see between the two radios operationally is that the FT-100D receives 900Mhz, whereas the 706 does not. Controlling a screwdriver antenna from the 706 is not all that difficult, either, and it doesn't have to be the ATAS-100.. Any screwdriver will work, and interfaces/autotuners for screwdrivers that will work from 160-6 exist as well. You won't be limited to 40-2 as you are with the ATAS-100+FT-100D.

Hope this helps in your decision.

Just a coment have a ATAS 100 works great goes 2-40 meters 80&160 meters
takes a lot more wire so antenna would have to be a lot larger, found that
MPG dropped 3 MPG with the ATAS 100 at freeway speeds from 31 MPG to 28 MPG
for what its worth. Have talked to most parts of the world on it tho. 73s

I don't know about the FT100 but the it has the same operating
system as the 706, and is similar in that respect to the TS-50
and the Alinco too. I don't like any of them because of having
to step through so many menus in normal operation. I prefer
to have enough operating controls easily accessible for normal
operation. I also didn't like the tuning rates. Tuning rate has
been a reoccurring complaint of mine with several digital encoder
type VFO's, as it takes forever to get across a band on the
slow rate, but at faster rates seems to just step over the band.

If properly set-up at roadside, they make neat mobile/portable
rigs because of their small size and light weight, but after
running a big box radio at the home station, these tiny mobiles
just seem like TV remote controls or PDAs.

My favorite for now is a TS-830s with VFO-230. There are
better radios out there, but cost 3-8 times as much. It is
spacious enough for comfortable operation and sounds and
looks great. The drawback is that there are fewer good
specimens left and parts are becoming scarce. I wouldn't
recommend a restoration project to a beginner, but everyone
should have at least one project cooking.

If you're on a budget, the best way to get on the air is to get
some hands-on with an Elmer's radio, then buy it when he
upgrades. Unless you're an experienced tech you shouldn't
buy a used rig without some hands-on.

That's because they couldn't afford the $300 adapter to make the ICOM
compatible with a standard shipping box.

This question comes up almost every month, should be a FAQ or testing
question for amateur exams

Most new transceivers support iambic mode B for their electronic keyers.
Some
allow you to change to mode A, others do not.

I will check the 756Pro, which may have as one of the menu options to change
to mode A

I'll wager the ubiquitous AA is available, even in the
remote parts of Bolivia.

A solar charger/adapter would be nice, for something like
a CD or minidisc too. Don't know how much current a 7600G
draws, but a 6V solar panel ought to cover it in the Bolivian
sun, I'd have thought..

Hello,

I am trying to figure out if my New FT-817 is really in fact "new."
Mine did not come with plastic over the display as every radio I have
ever purchased new has... and I noticed the manual had been used and
now I am finding that the audio on 2m is unreadable... I just got it
day before yesterday.

So, how did your new FT-817 come?

Heh, well, I don't know about you, but $800 for the radio, $200 for the screwdriver, and $200 for the screwdriver autotuner comes out to around $1200.. an FT-100D plus ATAS-100, plus shipping back to yaesu for repair at least once plus the 2-5 month wait comes out to about $1200....

I'd rather spend the $1200 and be able to TALK on my radio, which I did.. and I'm glad I did.

Standard shipping box? Well, the box it comes in would work nicely, however you won't need it.

> not true today.

Some TV's used 807's for the Horizontal output, and the tubes are NOT
built for a 15 KHz bandwidth. A Horizontal output is a PULSE
AMPLIFIER. Several of the early B&W Sweep tubes were IMPROVED 807's,
with modern bases so they could be made cheaper, and with the same
equipment other consumer tubes were built. Is the 8950 a TV tube?
Yes. It's the 6KD6 with a 12 volt filament. Several tube manuals
simply list the filament specs, then tell you to use 6KD6 Specs, because
they are built with the same internal components. As fare as being
non-linear, EVERY amp has some non-linear properties. After all, they
are used in the real world, not just on paper. By the way, some early
color TV's used 6146's for sweep tubes.

This will be the final reminder that the W8MMQ Antique Radio Page has moved.
Please update your bookmarks and web site links.

The address is now:
http://www.qsl.net/w8mmq/

There is a new feature on the site called the Radio Experimenter's Corner,
featuring vintage radio articles for experimenters and kit-builders. I am
open to suggestions. If you have an idea for this new section, please let
me know.

Visit the Radio Experimenter's Corner:
http://www.qsl.net/w8mmq/radioex/

And, over 1,200 radio mod files are listed on the site as well. If you have
any mods to submit, just email them to me and I will add them to the list.
Tip: If you can't find what you're looking for, try searching in the
/qrz_mods directory.

Over 1,200 Radio Mod Files:
http://www.qsl.net/w8mmq/mods/

Again, this will be the final reminder about the web site move, so make sure
you have the correct address. I want to thank Al Waller and QSL.Net for
freely hosting amateur radio web sites!

: now I am finding that the audio on 2m is unreadable...

Could very well be a reboxed POS return. In any case, now
is your chance to try it out hard to see if it's what you want before sending it back for a new radio (or a refund). Don't wait
too long to press the issue though.

Jim, ac6tk

For sale Tektronics 2465 Scope

Price: $1,500 Plus shipping (Money back guarantee.)
Feature: Portable, 300 MHz, 4-channel vertical deflection.
Very nice high end analog scope.
Cursors with digital readout for reading delta time
(and delta frequency) and delta voltage.

Condition: Excellent.
Only being used for a few months.
Has all manuals, 4 probes and pocket on back

Located in northern Massachussets area.

I installed the Ameritron ALS-500 500 watt solid state amp in my truck a lttle over a week ago -
getting absolutely GREAT signal increase reports on all bands I currently use - mostly 40 and 20
meters. I used Hamstick monobanders successfully - tho the coils heated noticeably at the higher
power, so I removed the coil wires from a 15 meter stick and installed an AirDux coil about 5 inches
long and 2 inches in diameter - I adjust it for the band I want with an alligator clip - works as
well as the stock sticks, no heating, and one antenna works from 40 to 15 meters...

As it happens, I wasn't talking through my hat. The Drake "4" line
and the Yaesu FT-101 both use sweep tubes as finals. Hmm, imagine
that. In over thirty years, no one seems to have complained all too
much about their non-linearity. In fact, both are known for good
sounding transmitted audio. Someone else pointed out that ALL amps
can exhibit non-linearity somewhere in their operating regime, but it
can be designed around. Oh, yeah, both transmitters put out about 130
to 150 watts.

I think the ideal would be a tube front end (ability to handle static charges, etc) followed by a solid state mixer and digital PLL VCO for tuning. Follow that with solid state IF stages followed by DSP circuits and finally a tube audio circuit :) That would be optimum.

> ---dave---

If you want all band 160m to 70cm, then I think the ft-100 or
ic-706mk2g would be good choices. If all you want is HF, anything will
work nearly. You could save a lot of $$$ just going with HF only,but
of course no 6,2,70cm all mode. It's up to you and how much you want
to spend. I have HF only rigs, such as the 830/vfo 230 already
mentioned, drake twins, IC-730, etc. I recently bought a ic-706mk2g
also. What do I use the most lately? The 706 hands down. It's a handy
little unit. But I do have to say that I run my 706 though the
computer sound card and I use a good mike"audio technica". So it
doesn't sound small. It actually has slightly better SSB receive audio
quality than my 830. And the 830 is no slouch in that dept, and I'm
very picky. After a while I got spoiled being able to run all bands
with one rig being as I do SSTV, PSK etc. I can jump from 20m sstv to
2m sstv in 2 seconds, and never change a cable. But it's what it
receives that really seals the case for me. I listen to SW-BC, AM-BC,
aircraft, police, etc,etc which I can't do on any of the others. The
receive capabilities are why I decided to go dc to light for a rig.
The 706 is more versatile than all my other radios put together. It
will do nearly anything.My other rigs just sit there and collect dust
for the most part. But I still keep them. My 830 is good for hard core
HF use where I want good filters etc. My 706 is the everyday average
use rig and mobile. It's basically a replacement for my older ic-730.
BTW, I've never tried the ft-100 to decide which is better, it or the
706. So I can't say for sure. But when it came down to plunking the
cash, I went with the 706mk2g. The 706's 100% duty cycle compared to
the ft-100's 50% had a lot to do with this. Also the ft-100 needs 22
amps to do 100w, where the 706 only needs 20 amps. I thought it was
kind of strange to need more current than most other rigs. So I went

706. I haven't regretted it so far. When you compare a HF only rig to a do it all rig, the hf only gets boring fast once you've tried both." unless maybe you have seperates for all the bands." If I was stuck on an island and could pick only one radio to go with me, it would be the 706 both hands down over all my others. MK

Frank,

Mark Mandelkern, W5AM (originally W9ECV from Wisconsin)
would be a good contact (when he is not in a contest !)
email: k5am@lascruces.com

From his articles, it seems Mark was able to get Signal One radios or
assemblies from a source in New Mexico.
He had an article in March/April 1999 QEX magazine on a High Performance
Homebrew
Transceiver based on some Signal One SX-7 and SX-11 designs.

Paul Kollar, W8CXS (sk, 2000) was probably one of the biggest supporters of
the Signal One transceivers.
I do not know what happen to his collection (and parts/repair) following his
death.

Kinda sounds like a returned radio. I don't know if the 817 has
plastic over the display, but I would be surprised if it didn't. I
know the 706 did, which I still have on it BTW after 8 months..I leave
it on until it finally falls off to protect from scratches. The used
manual and 2m problem would have me on the phone a bitching. I'd want
a new one in the box if in fact that is a return. I know my 706 wasn't
touched before I got it. It's fairly obvious, when all the plastic is
sealed etc, the manual is fresh with no wrinkles etc. I'd be on the
phone pronto to that bunch. I think you bought a used radio. Maybe
anyway..MK

It's hybrid. All solid state except for the driver" 12by7" and finals
"6146b".
You don't want to mess with it. Nothing wrong with tube finals, and
they run very clean with the - feedback circuit. A classic good old
radio. I woudn't touch it. If you want solid state, trade it or buy
another rig. The 530 along with the 830 are very good rigs for their
times, and still are very usuable. BTW, you can use the vfo-230 on
that rig if you want a totally stable vfo that doesn't drift. MK

5632. help with sb-102

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-07 22:08:35 UTC
From: "Neal W. Nichols" <nwn@abac.com>
Message-ID: <3BE9B0E3.3521B77E@abac.com>
Source record: 52336

I'm trying to restore a Heathkit SB-102 transceiver which has been in a shed for about 10 years (and I don't know anything about it before that). It hears fairly well, but the receiver section is plagued with tons of birdies whenever any signals are present. The birdies are not there under no signal conditions (no antenna or with a dummy load), but turning on the xtal calibrator without an antenna, or listening with an antenna brings them right back. On air signal reports say that it sounds quite good. I've checked what the troubleshooting section suggests, and all seems fine. I don't presently have access to a tube checker. It also has a low level hum both on transmit and receive.

Any help would be appreciated. I have a friend who would like to pick this up as a Christmas gift for a grandson who should have a license by then.

Thanks, and 73;
Neal,
WA9FTU

Can I add a resounding "I AGREE!" to that? All I have for gear is an Alinco DR-135 for the car, and the 706 as my base station, and I'm glad I went with the 706.. It's been trouble free, clean, clear, and fun. I get nothing but "What the heck are you running over there, it sounds great!" I've never gotten a bad signal report, be it phone or PSK.

Add that to my other testimonial in this thread. I do hope you pick the right sets, Dave.

73 and good luck on your upgrade!

5636. SB-200 amplifier repair

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-08 00:08:59 UTC
From: Rich Griffiths <richg@one.net>
Message-ID: <3BE9CD1B.8F1D6BC2@one.net>
Source record: 52339
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I recently picked up an SB-200. It wasn't behaving quite right, but the price was very good.

It had about 30-40 mA of plate current when it was unkeyed (should be zero), about 60 mA when keyed but idling (should be 90), and about 250 to 320 mA when driven (should be 500). The grid current readins were similarly weird. The plate voltage was Ok.

I found a bad resistor on the grid of one of the two 572B's and an out-of-spec resistor on the other. Each tube is supposed to have a 33-Ohm, 1-W resistor connecting the grid to the bias line. One resistor reads 42 Ohms; the other is disintegrated. That explains the symptoms.

Now ... is there a Heath-amplifier expert out there who can tell me if I should just go ahead and replace those two resistors? Should I still be searching for a cause of the failure? (I don't see any obvious cause.) At one watt, I would think they could easily handle the expected dissipation (50 mA per tube => about 80 mW per resistor). Should I go for 2-W resistors anyway?

... Rich W2RG

Body handling: HTML body converted to readable text

Palomar High Power 4:1 Antenna Balun - Ebay

High Power 4:1 Balun. This is the Model SB-4, which was made by Palomar. This is a heavy duty model, designed to run 2000 watts continuous power, at SWR's up to 10:1 (Palomar's specs). The impedance ratio is 4:1. Great for high-powered long-wires or loops. I was using it with a 202' long-wire, and had excellent results on 160 through 15 (using an SB-220).

Condition is "like-new". I paid $75 for this about 5 years ago (I took down the long-wire three years ago). When I was using the balun, it was mounted indoors, so it was not exposed to the weather.

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

Pay by money order or PayPal. UPS shipping charges will be estimated based on the weight of the packaged item and your shipping address. Hi Michael...

: In rec.radio.cb Michael A. Terrell <michaelaterrell@netscape.net> wrote:
: Some TV's used 807's for the Horizontal output, and the tubes are NOT
: built for a 15 KHz bandwidth. A Horizontal output is a PULSE
: AMPLIFIER.

I'm about laughing out loud to think of a poor old 807 screaming it's fool anode cap off doing horizontal output duty. That must be one really old TV. An 807 tube is a very popular audio amplifier tube and it was the subject of some HF RF Amplifiers. I have a few articles in my files of said. Some even converted the similar 1625 to audio service.... boy we're going way back now.

: Several of the early B&W Sweep tubes were IMPROVED 807's,
: with modern bases so they could be made cheaper, and with the same
: equipment other consumer tubes were built.

: Is the 8950 a TV tube?
: Yes.

No it is not... no TV that I've ever seen or heard about had one. As I mentioned, it was designed by GE for beam power applications.

: It's the 6KD6 with a 12 volt filament.

No it is not, the 6KD6 has lower transconductance, lower plate dissipation, different internal capacitance values and probably a different pin out. The closest conventional sweep - beam power tube to the 8950 was/is the 6HF5. One can upgrade a Swan 350 from the 6HF5 to the 8950 with relative ease. I have done a few in my day.

: Several tube manuals
: simply list the filament specs, then tell you to use 6KD6 Specs, because
: they are built with the same internal components. As fare as being
: non-linear, EVERY amp has some non-linear properties. After all, they
: are used in the real world, not just on paper. By the way, some early
: color TV's used 6146's for sweep tubes.

Similar but not exact... the 8950 along with the similar type Maco output tube should be treated as different. Not only was the 6146 used in TV's, one can find it in the very popular early Ampeg SVT Bass Guitar Amplifier. Loud as heck and heavy like a boat anchor... but man it has some tone.

cheers

Hi Rich,

The most likely root cause of the grid resistors being damaged is someone overdriving the amp or applying an excessive drive signal for too long during tune-up. There is a possibility of a problem with the 572B tubes but if the idle current is correct with the resistors repaired then the tubes are probably usable.

I have had the SB-200 and never had any problems even running AM mode at very reduced drive levels.

Rich -

You should perform a "visual" test for other cracked or
bad components. I also perform a "nose" test to check for
burnt components.

Going to a resistor with a 2 watt rating should not be a problem.

Consider adding the "soft key module" (Harbach)
to lower the keying voltages for the modern solid state transceivers

The "soft-start" is a good idea, but a personal choice.

Awhile back, I bought a hi-end cd player that turned out to be obviously used, or at least a demo. Took it back the next day. The guy acted shocked. I ignored him. Just told him I wanted my money back. No bs. Gimme my money. Got it.

I'd just return it. Ask for your money back, 100%, no restocking fee, especially since it's obvious you got a rig that's already been restocked. Then buy another rig someplace else. No sense in taking used crap from anybody, especially if you're getting bad audio reports.

It's usually pretty obvious when you're getting equipment that's not new.

Thanks For Reading My Posting. Information please reply via EMAIL ONLY !!
ngwd@ngwd.com

For Sale: Icom IC-737 transceiver covering 160 - 10 meters. Built-In Antenna Tuner. Non-Smoking Environment. Radio is in good working condition, (never been mobile), and power cable. No Mic, Do have Copy Of Owners Manual. Works perfectly in all modes and on all bands. General coverage mod. has been done. This is a 12 volt DC rig, and would require a 12 volt DC / 20 amp power supply for base operation.

Price $585.00 + $20.00 Shipping CONUS

The RASCAL is an interface that goes between the sound card in a computer and the radio. It relies on a port on the radio that allows incoming and outgoing audio frequency data. If he's trying to hook it up to his microphone port, he may have the wrong type of RASCAL for that radio, or if he's hooking it up to a port on the back of the radio, he might have the port miswired, or some menu option on the radio set incorrectly. There's a hundred things that could go wrong. He might have the audio cables in the sound card incorrectly... he might not have his software set up correctly to key the radio through the proper serial port... in short, have him make sure his configuration is correct. Then have him double check his soldering/building of the interface.. He might have crossed a couple of wires, which would cause problems...

In short, if the radio was functioning when you sent it to him, then he probably built the interface wrong, or has the wrong menu options set for comms... Suggest that he set the packet rate to 1200 baud for the output port, or contact BUXCommCo about the interface...

Hope this helps.

My FT-817 had the plastic on the LCD, everything was sealed up, etc.

I did get a used radio from one of the major dealers some years back. It was very obviously used--not properly packed, scratches on the case, a stripped screw on the case, didn't receive hardly at all. It actually took several phone calls to the dealer to straighten it out, as they insisted it could not have been used. That's one dealer I'll never buy from again.

Source record: 52252
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Greetings.. I picked up a Icom W32 that I believe may be a W32E One of the items in the manual under settings that says "USA Version only" is missing, pressing PTT twice sends a 1750 hz tone, and what I consider somewhat annoying is the SQL/Monitor button monitors the INPUT.
Questions: Is this inface a W32E?
Can I change any of the above settings?
Any advantage for a w32e v.s. W32A?
Any DISADVANTAGE for a w32e in the US?
Also a general question, reading the manual and using the radio, it appears I can only have the the alpha reference for the radio and the HCH.01 in large letters configuration? Is there a way to display both the alpha name and frequency, i.e. WB6VHF / 147.000 ?

Many thanks.

Paul -

Please do not hack into this radio ! The radio is not economical for this type of conversion
and its just $$$ out of your wallet. Kenwood already did this, its called the TS-430 transceiver.

I had a TS-530 radio during the 1980's - it is a SOLID radio, built on Kenwood's experience with the
520 series. This radio is actually easier to load into many antennas, than early first generation (TS-430, TS-440)
solid-state rigs that required external antenna tuners.

If you wish a solid state rig, sell it or swap it for a radio you desire. There are a number of used solid state radios for under $ 1,000 on the market.

I would try the normal surplus dealers
(Fair Radio, Lima Ohio; Leeds in Brooklyn, NY; and in Texas, etc.)
Sounds like the specification for an HW-16 or DX-60B transformer
----

Try Surplus Stuff - I got lucky here with their current surplus Collins
power transformer
http://surplustuff.com/xfmr.html

Here are some of my standard look-ups - at least for the telephone call

Cin-Tran, Cincinnati, Ohio was one supplier of Drake Transformers
http://www.cintran.com/

Heyboer Transformers, Grand Haven Michigan
They supplied some Heathkit transformers
http://www.heyboertransformers.com/index.shtml

Peter Dahl
Peter can wind or fix about any transformer.
He may not be the cheapest price, but solid quality.

FOR SALE:

HAND-CRANKED MAGNETO GENERATOR! Produces
120V AC. These will provide about 20-30 Watts depending on
your cranking speed!

The size is about 3" diameter and 3" deep with retracting handle.
Fluke freq meter shows around 20 Hz on one pair of terminals and
around 60 Hz on another.
You can mount these behind a sturdy front panel with a single
hole and the large nut provided.

Will sell for $25.00 each plus $6.50 USA shipping

Picture available

>
> ... Rich W2RG

I don't think it would matter much on the size of resisters. If you
have the manual I believe they may have a "before start" checkout
routine that you can follow. You check resistances etc, with no power.
I'd go though that before you fired it up. It's possible you could
have a bad tube or two. MK

"Similar but not exact"? What happened to your "not a rock solid rule" excuse? Oh well...

I did a little research, and the 8950 was a 6KD6 beefed up for RF service. It didn't get much call except for inexpensive amateur equipment (just like sweep tubes), then it died.

It doesn't make any sense that a TV set would be designed using a 6146 for the sweep tube when less expensive and more capable tubes exist. I have TV service manuals for sets going back to the early 50's and none of them use a 6146. Maybe you can enlighten us as to the make and model to which you are referring?

Hey Bill,

I remember you now, thanks for the speaker btw, I am stil enjoying it today.

It would appear that two people are interested in the Kenwood, I have not received a money yet, but supposedly one is en route. If I do not receive one in the next 36 hours I will keep it for you.

The rig is in perfect condition, a 9 out of 10 both in condition and operation. The new batteries that come with it enable it to TX. at full power and they are strong NiMh cells. The only reason I am getting rid of it is to purchase two Icom W32A's. Icom is not making them anymore and I am a big Icom guy.

Thanks my friend,

will keep you informed.

Just a word of advice -- I have a 1.8 filter on one of my rigs, and received ssb audio sounds very muffled and unpleasant through that filter. I rarely use it; I just go with the passband tuning for qrm.

If you install the 1.9 filter, hopefully you can switch it off when it is not needed, rather than it being there all the time.

Brent, my set up is this, I run and ICOM 706 MKII and feed a Ten Tec Hercules solid state amp (550W). My antenna is a Bandhopper screwdriver. This is installed in an '87 Camry. The amp and 706 are trunk mounted and I have the control heads up front. The TenTec makes a remote control head for the Herc. I also added a second battery also trunk mounted.

Have had great signal reports and its a ball to operate from the car.

Is this on all bands?

Xtal IF filter was always intermittent on mine, and I
could never afford a new one. I changed the top cover
screws with thumbscrews so I could rap it whenever it
acted up. Also it was nice to be able to keep my fingers
warm in the winter.

The birdies might be from a dirty bandswitch on the
hetrodyne crystal pack, or even from a shorted coupling
cap or AGC problems. If you had another general
coverage reciever or a spectrum analyzer, tracking it
down would be a snap.

Be aware that a boatanchor restoration is a labor of love,
often costing more than a newer rig in good condition.
To be really appreciated one must invest of oneself. If
you do all the work, the new owner won't have any
connection with your radio.

Schematics available at;
http://www.circuitarchive.co.uk/heath.htm

The SB 100 gifs are lots easier to read and very similar.
The SB 102 gifs are a bit rough.

Jim, ac6tk

5677. Need multicoupler for 3 radios

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-08 16:20:21 UTC
From: johnfofawn@hotmail.com
Message-ID: <d89364bd.0111080820.4d0317f@posting.google.com>
Source record: 52280

Hi,

I've got two Icom 756 Pro's and one Icom 756 Pro-II. I'd like to connect all three radios to my B&W ACS-1.8-30 HF antenna.

I'm currently using an Alpha Delta 4 position console switch, but that only puts one radio on the air at a time.

Are there any multicouplers that you can transmit through (obviously only from one radio at a time), or will multicouplers only allow receiving (that's okay, if this is the case)?

What brand multicouple should I buy? I'm thinking 4 ports would probably be sufficient.

Thanks!
John

Neal -

I going to make a "big" suggestion here. If you are going to give the
SB-102
as a gift to a young "new" amateur - PLEASE do NOT hand them an older rig
like this that have not been properly repaired and aligned.

A new amateur has alot to learn and the grandson may lose interest in 2
months
if it doesn't work right (personal experience talking here). A lot of
knowledge that
we assume is "intuitive" -- is not (we had to learn most of it).

Also, you should make sure the new amateur has an Elmer available
(either on-line or better yet in person) for "all of the dumb questions"
that "we asked"
when we started out.

Caitlyn Martin does a good job moderating the THP reflector and FAQ,

but as his web site points out: There is no current U.S. dealer or
distributor for THP
(U.K. yes, but that is a bit far for my service/warranty)

I have the MFJ unit you're talking about. It's the model 4114.
List price $69.95 at any ham store. It will work with any of
the 90xx or 94xx rigs. I use it with my 9420.

Most are incomplete and just copies of Granbergs application notes.
> Or if anyone has other sites that sell mobile amps
>that would be great. I have a few so fare SGC, Worth-More, Ameritron,and
>Henry... Any others would be great!...
Not much else left.

Just to be different I collect nothing but QRO mobile HF amps.

To the above you can add:

Metron - No longer made.

Tokyo Hi-Power another 8 device unit but difficult to find a dealer.

Don't touch the Ameritron, it's a pile of junk.

The SGC's a nice unit but runs hot if you're into RF processing. You
also have to watch your antenna matching as it will trip out.

Go for the Henry, rated at 750w pep out, probably best of out of the
currently available crop.

Nearly forgot the Ten Tec, but somewhat expensive for 500w.

I've melted two BB3 160m Screwdriver coils so if you're going to run
power on the low bands run a Bugcatcher or Screwdriver who's factory
will guarantee no burn out!

> the make and model to which you are referring?

The 6146 was a very popular final output tube used for
low band VHF service (30 - 50 MHz) commercial radio units (Prog Line?)
from General Electric (GE). The RF section was one of the most
solid designs from the period. Of course, they were selling it to
the local and state law enforcement agencies. The only problem was heat.
Today, small reliable fans, Teflon wiring and modern capacitors
can be easily address and handle this issue.

Now you have me thinking about a winter project.

They are telephone ringer generators. That is about all they are good for. Used in field telephones ?? or the
old phone systems before the dial telephone.

5690. SWR Meter: Vanco, check Ham or CB Antenna - Ebay

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-08 22:41:20 UTC
From: Dan Long <w4tq@mindspring.com>
Message-ID: <9sf1qc$a2q$1@slb5.atl.mindspring.net>
Source record: 52292

SWR Meter: Vanco, check Ham or CB Antenna - Ebay

This meter is in good condition. I compared its calibration with two different $150 meters that I have, and it compared very favorably.

For those who aren't familiar, this meter checks antenna operation by measuring the ratio of reflected power to forward power. If the ratio is high, it indicates that the antenna is not correctly matched to the feedline or to the transmitter. The meter will also show a high ratio if there is a bad connection.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1294175977

Pay by money order or PayPal. UPS shipping charges will be estimated based on the weight of the packaged item and your shipping address. I will send you the UPS tracking number, which you can track via the Internet. The item will be shipped immediately upon receipt of funds, and will be packed properly, to help assure safe delivery.

Note concerning operation:
To operate, the output of the transmitter is connected to the bottom connector, and the antenna is connected to the upper connector. The switch is moved to the right, and the knob turned counterclockwise. The transmitter is turned on. The knob is turned to the right until the needle is aligned to the set point on the scale. Then the switch is turned to the left, and the SWR is read from the top scale. The SWR should be below 2. Then turn the transmitter off.

I will be glad to provide additional information. Contact me at
w4tq@mindspring.com

Like new condition, purchased as kit in January of 2001 and professionally assembled. Includes auto-tune cable for Icom IC-706 radios. Works perfect, have been using with a 20' vertical flagpole (antenna restrictions) on 10 thru 75 meters. More information available at LDG website www.ldgantennas.com. Asking $200, includes shipping and insurance to your address. Steve W7AZF

5696. TS-830 Repair

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-09 01:34:05 UTC
From: Phil and Nancy Young <pyoung@iland.net>
Message-ID: <tumcb1j836kmc6@corp.supernews.com>
Source record: 52199

I need some long distance radio repair for my aging TS 830.

Symptoms:

1. Fails to transmit or receive -- no digital display -- dead on USB
2. Works normally on LSB
3. Tapping circuit board in vacinity of USB crystals will bring it to life
(it did for a while)
4. Adjustment of USB crystal trimmer will bring the radio to life, but no
audio heard until VBT adjusted to certain spot
5. Will transmit and receive on CW, but only receive on SSB.

Suspicion - Faulty USB Crystal

Any other theories?

Re-solder all the connections on the board. It is likely that you have a
cracked or "cold" solder joint somewhere on it.

A military "multiplexer" should done what you want to do. Fair Radio Sales
has had some in the past.
These units are used to allow serveral radios to use one or more antennas.
The transmitter/reciever "multi-plexer" is the one you want.
Don't ask me what number to look for. It may take some experimenting to
find the right one.

Okay, Okay-- I respect a good piece of equipment also, and nothing's going to get hurt here. I had bid on a TS-530S on ebay thinking it would be appropriate for HF mobiling but now finding out it needs some HV and filaments, am glad I lost the bid. I was sweating it out for a while though, wondering what I would do if I won the bid, maybe if I should keep the XYL from finding out, etc., and learned a few important things in the process.

Thanks for the responses !

Hi Guys;
I have this like-new Yaesu FRG-100B,
in the original shipping carton, Manual & power supply.
It belongs to a friend, He only bought it a few months ago but it does'nt say
FRG-100B on it, only FRG-100. Did they(yaesu) not change the numbering on the
radio, he told me it was a 100B.
This is a Great ShortWave Receiver which has been given a 5 * rating in a
shortwave guide book.
Don't miss out on this one.
Anyway,it is like new and will ship for $320.00 Conus.
No Trades, M/O only.
Thanks es 73.....RICH-WA2RQY RLUCCH2098@aol.com

Interesting, My FT-980 power supply runs hot and has no fan. There is a fan on the heat sink for the finals that goes off and on. But the power supply does run hot. I always wondered if it was normal, as it gets VERY hot..

I mounted mine on a small board, about 8"by8" which I stained and varnished. The board sits on the floor of my minian and is pitched upward at about a 30 or 40 degree angle with another board that is perpendicular to it from the bottom front. Doesn't move an inch in normal driving. I suppose in a rollover type accident it would be a different story.

5708. Ever rack mount an MSF5000?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-09 05:15:20 UTC
From: Justin Knerr <kleptein@hotmail.com>
Message-ID: <fdpmut4b227oqvh5i7vv090eitme58dgdv@4ax.com>
Source record: 52212

Our club recently aquired an MSF5000 in a small cabinet. Our repeater site has no room for more cabinets, but plenty of open rack space. We'd like to take it out of its cabinet and rack mount it, but it seems to be built in to the cabinet its in. Has anyone ever tried this, or does Motorola sell adapters/kits/etc to make it happen? Specifically, the frame rails that the PA and power supply sit in are welded to the rails inside the cabinet.

Any tips/suggestions?

Thanks!

5713. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-09 06:16:59 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <9sfscr$po2$1@news.hawaii.edu>
Source record: 52217
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information

posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis- trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is NOT the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent. This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Paul -

Actually I have seen many candidates on eBay, for mobile service.

TS-430 and TS-440 will work as long as you are 2:1 or lower and/or
use a "screwdriver" style antenna

Not as small as the Icom 706, Kenwood 50S or new 817 - but workable.

Dave -

There are a number of choices. I have heard the same negative reports
about the FT-100D radio (some of the jokes reminded of the European car
jokes in the 80's -
in the service shop more than on the road)

Be reasonable for your first investment, since it is a starter radio. It
will then
allow you to branch into specific areas (and there are many) of amateur
radio
that interest you.

The 160M to 70cm seem to be popular, but radios this general (or broad)
have design compromises (size, screen size, power, sensitivity,
selectivity).
Just be aware of what these are when you match your criteria to its
specifications.

5719. TEST EQUIPMENT Manuals on CD-ROM - FLUKE/TEKTRONIX/HEWLETT-PACKARD

Newsgroup: rec.radio.amateur.equipment
Date: 2001-11-09 08:26:37 UTC
From: Mike <mdavids@erols.com>

FOR SALE: My company is now offering something for those interested in test equipment and electronics. I have compiled CD-ROMs full of military manuals on Fluke, Tektronix, and Hewlett-Packard test equipment, the three most popular makers in the test equip. business. I have sold piles of these on Ebay and other auction type websites, and I am now offering them for sale outright to anyone interested. If you wanted to get test manuals from these manufacturers, they'd cost you about $25 to $30 a piece, but these disks are full of government publications, much better written and organized than the commericial versions, for a fraction of the price:

15 Fluke manuals on CD-ROM: 31 megs of data, $7.95 per CD-ROM
46 Tektronix manuals on CD-ROM: 81 megs of data, $14.95 per CD-ROM
110 Hewlett-Packard manuals on CD-ROM: 289 megs of data, $24.95 per CD-ROM
